CURIOSITIES OF SCIENCE AND INVENTION

MOTOR-CYCLE AUXILIARY FOR BICYCL

A power attachment for bicycles has recently been invented which calls for no structural elterations to be made in the ordinary bicycle and which can be attached or detached in a few minutes. The dovices etterned or decented in a few minimes. In a correct comprises a small nutrillary when 20 inches in dismeter fitted with a light motor which is connected to the rear wheel of the blcycle. An ingenious pivoting

A POWER ATTACKMENT-FOR RICTCLES.

arrang arrangement allows the whom a pocumar lateral and workleal movement, so that the steering of the ma-thine is in no way affected and permits the wheel to glide over obstacles or rough ground without trans-

thins is in no way affected and permits the wheel to gife over obstacles or rough sround without transmitting any shock or vibration to the rider. The motor is a small air-cooled, herricantal, two-arrole enatine with a specially designed but to which a specially designed but to which the state of the st

to carry the motor 100 miles

A NOVAL MIDEA-PCRATTAL PRIMARY SATTERY.

A new and ingentous high potential primary battery, the purpose of which is to supply electric short and a supply electric short and a supply electric short in Magnilar Physical Society. The positive senses of each cell cranists of a small carbon red, while a strip or mays size countries the nature short in the state.

each cell consists of a small carbon rod, while a strip of pure sinc comprises the negative clement, the also-trolyte being a solution of calcium chloride. The connected ends of the elements, which are mounted in parallel rows of 26, are buried in parassis.

A MYGROSCOPIC MIGH-POTENTIAL BATTERY.

CARRON ELEMENTS.

Contact between the free carbon and the sinc elements is just broken by a small pellet of parsfin, and the liquid is retained between them by capillarity

itquid is retained between them by capillarity. The electrolyte comprises a enturated solution of calcium chloride which has been exposed to the air, lieing hyprocopic it will shoor water until a certain equilibrium etrength is obtained, this factor depending on the humidity of the air and the temperaturs. The electrometive force of such cell differs from one voit by only two or three per cent if exposed to very different conditions of temperature and humid-ity, but it has been kept stoady to within 01 per cent

for two or three consecutive days.

In conjunction with an obstroctatic voltmeter, the battery is very convenient for the following purposes In all experiments involving the use of a quedrant voltmeter, as the needle can be charged to any desired voltage up to 1,000 volts, since the battery is so de-signed that one or any number of elements can be taken, for the comparison and calibration of electrotaken, for the comparison and cathration of electro-stetic voltmeters, for the comparison of capacities, and for the measurement of high resistances by the method of discharging a condensor through them and noting the time taken

DETROTOR FOR FIRE-ALARM BOXES.

DEFINITION FOR PIER-SLAIM SOLES.

The problem of so designing a fire alarm box that it can be opened and operated by any one in an amergency and ret will tend to pervent the sounding of falso alarms, is one that has engaged the stending of falso alarms, is one that has engaged the stending of linear tending the state of inventors for many years at very impulsion additional content of the state of the stat operator of the alarm, whose services might be badly needed at the fire Instead, however, the handons

chould be of vaine to small as well as large dealers. The machine consists of a magazine and a means of taking one cap at a time from the magazine and preseng it firmly into piace on the top of the milk bottle. It not only adds to cleanliness in dairies, but saves e inasmuch as it is many times more rapid in the operation of capping bottles than the hu

thing she was a midsummer night's
dram. It was only by as effect of resson, or when, through a powerful glass,
we distinguished animals in motion, that
we restised the home of seven hundred
thousand souls to be other than a microscopically beautiful toy

creacopically beautiful toy
"When nearly above the office of the
Inquirer, we celebrated this occasion by
fying our balleat and shooting upward,
which turned us more to the east, and we
were above the Delaware, at an altitude
of about a mile Here we verified the
fact that we could see with the naked
eye the bottom of the river, and with a large apygiass clearly distinguished the great stones in its bed "Indeed, one of our fellow voyagers in-

"Indeed, one of our fellow voryagers in-sisted upon it that he observed the mo-tions of the fish. Certain it was that the ripple of the plying steamers was most marked, and then we turned to the ship-ping Havio't taken a particular squint at the Island of Smith, and the still more celebrated Thicum, we reached the Jersey side at five minutes peast the descript Centrol in all its pitory. The ourrent took us more directly toward the iowed closely the Camden and Atlantic Railroad, which could only be distinguished from the turnpikes by the aid of guanted from the intriplices by the aid of a giass. In the moving panorams, the fertile fields of East Jersey formed a most beautiful portion with the Rancossa and Co per's Creek winding anakelike through wes oblong inminutes, distinguished only by the different colors of ripe wheat, growing corn, and other to-kens of peace and planty Toward the ocean, a bank of cumulus clouds rose up, ocean, a bank of cumulus clouds rose up, and in the west the city was growing dim. We passed over Haddonfield and near Long-a-coming and Waterford, then began to go much higher and faster, havpassed right through a flercy cloud leath us stretched almost interminable pine forests, with the white sand sparkling here and there in timy patches We were at this time at the highest siti tude attained during the trip, about three miles, and moving to the east at the rate of at least sixty miles au hour Here the earth appeared convex instead of concave, a appeared convex instead of concave, as pheanmenon often observed and ac-rounted for, but some the less curious, and high as the barrometri. location of their bodies. We includingly got up the lad vier into the hoop and insisted on sing-ing some, which, owing to the rarefaction of the sint and the orbo from the bodies. had quite a sentorian effect. At this point, as we were far above the smoky bees surrounding the earth, and also the region of clouds, the aky looked more beautifully bits and wirld than can be beautifully bits and wirld than can be beautifully bits and wirld than can be sufficient to be proposed below, save to the few clouds that to use the work of th

minutes The atmosphere, even at greatest elevation, was not so cold as expected, owing to the rays of the sun aspected, owing to the rays of the sun being purearily refrared from the hary clouds below The chief physical mani-leratation of our situation was in the ears, for when descending from a more rare-fied to a dense ratnophere there was a whitsing, much like that in the diving, and from the amme cause.

"Although it had been the accounting the annual to the companies of the companies of the intention to mach the companies.

intention to reach the ocean, which now was visible, the salis on it being seen by was vision, the sails on it being seen by the talescope, yet a delay of two hours, occasioned by the vastness of the prepar-ations before starting, limited the time so that it was an alternative to land on a swhat uninhabited coast without day somewhat uninabited coast without cap-light to direct us to a proper spot, or take the back track. The latter course was most prodent in reference to the se-curing of the balloon, and as affording

Philadelphia So we came down very fast, aided more than was entirely desired by the failing dews, and the con-traction of the gas after the auns rays had so much diminished. However by a wholesale throwing off of ballast, we kept wholesale throwing on or uninar, we acquire to the northwest, until observing that a crowd was gathering from all points of the conjuss in the neighborhood of Medford evidentity calculating on onr descent and shouting loud invita tions, we gratified them and promised their assistance. A large number of willtheir assistance. A large number of which me men caught hold of our long trailing rope by Mr Lowe's direction Our gas was allowed to escape freely, and we handed on a large sand bur one of the best places that could have been selected, at a quarter past eight after about sixty miles of the piesantest voyage it is possible for man, the unwinged bird, to

VERTICAL PROTOGRAPHY

(Concluded from page 256)
ground is placed under the glass supporting the article to be photographed.
The distance between the support and the background varies from three inches io eighteen inches. The greater the distance the less reflection. The color of the background is generally determined by the color of the object to be photographed When working under the aub-ject, the light can be reflected under, rendering the background more tone, or on the subject proper, giving not only more illumination but illumination of greater uniformity Some subjects re-quire a neutral ground. In this case the photographer will change his back-ground many times during exposure He ay start out for lustance, with a pure may start out for instance, with a pure white ground on top and remove grounds which are piled one on top of another until he passes through many shades, ending the exposure with probably a vivil red This changing of backgrounds during an exposure with often bring out an object that would have other

Cameras are manufactured especially for work of this nature and have scales of measurements so arranged that the ground glass support is part of the camera proper but movable either way camera proper but moveste either way with a tituub screw, so that an allow-ance can be made for objects of various this knesses. By attaching the support to the camera the camera can be swung or revolved during the exposure giving a uniform illumination to the subject. a uniform illumination to the subject. The camera may be supported by a tripod in a vertical position, as shown in
the illustration. When in the field the
camera may be suspended from a tree Hmb

A stand, such as shown in the titt tration, may be easily made and will answer all purposes admirably Any camera can be thus used with good re-

A tilting tripod head which is aimple in construction and inexpensive in cost, may be used in this style of photography to a good advantage. In many cases most pleasing results have been secured by this simple device. A sheet of glass for a background a tilting top for triped, and the outfit is comuleto

INTERNAL COMBUSTION PUMP

(Concluded from page 257)
of the column of water cannot be suddenly arrested hence the pressure in O
tonds to fall below that of the atmosphere and the exhaust valve # opens as
well as the water valves V Water rushes in through the water valves, mostly follow the moving column in pipe rollow line moving column in pipe D., but partly to rise in chamber C, in an effort to reach the same level within that chamber as in the auction tank When the kinetic energy of the moving column gas has ampended itself by forcing water into the high level tank, it comes to rest, and, there being nothing to prevent a re-

turn flow, the column starts to mov back toward the pump, and gains veloc ity in this movement until the water ity in this mavement until the water reaches the level of the exhaust valve, which it shuts by impact. The result is that a certain quantity of burnt products of combustion becomes imprisoned in the cushion space F und the energy of the moving column is expended in co the moving column is expended in com-pressing this gas cushion to u preater pressure than that due to the static head of the water in the circuit tank B T Consequently a second outward move ment of the column of water takes place. ment of the column of water taxes much and when the water resultes the level of vario E the pressure in the space F is oner more method, and further movement of the water opens valvo A by suction against a light spring, and by saction against a light spring, and draws in a fresh guscous charge if there were no friction the water would fall to the same level as that from which the last opward motion staried, but the amount of caminstible charge drawn in is slightly less than this movement would represent Once again the column of water returns under the clevated tank of with returns under the elevated tank pressure and compresses the charge in the combustion chamber which is then ignited of the moment of maximum com-pression, and the same cycle of opera inne is repeated

Ignition is timed by a small an paratus somewhat resembling an ordin ary engine indicator, which closes the electric ignition circuit at the point of maximum compression, an ordinary small battery, trembler coll, and sparking plug as are used in automphile practice

as are used in automnille practice in starting the jump for the first lime, compressed air is allowed to flow into the combination chamber intil the volume of air introduced is rather larger than the usual charge. The exhaust valve is then auddenly opened by means of a hand lever, and the escape of the compressed air permits a movement of the water col umu, which gives the cushion and suction strokes, and so draws in a fresh com-bustible charge, which, when the current is switched on and consequently fired, starts the pump working regularly When the pump is stopped in the usual way ir regular work, it always stops with a fresh regular work, if always stops win a rresul-charge of explosive mixture present in the combustion chamber, so that it is only necessary to switch on the current and the pump is started up. This enables the pump to be set in motion from the switch-board and without any preliminaries

is now in regular daily work at a large pumpling installation in the Midlands, giv-ling complete satisfaction. The absence of all completed gearing such as exists in all completed gearing such as exists in standing feature, and guards the engine standing feature, and guards the engine saginate breakdown, in only port that could fall beling possibly a defective mashroom valve or gyring. Wear and tear is also reduced to an insignifi-crat quantity, and the treshbes hecidantial is now in regular dally work at a large

cant quantity, and the troubles incidental to inbrication are overcome.

In its simplest form the apparatus converts gas power into hydranile power, and may, therefore, be called a gas pump, but if the power is to be taken of a rotating shaft, the high pressure water is passed through a water turbine, and so lack to the suparatus to be continually circulated. The transfer over the territory of the suparatus of the continually circulated. The invention can also be applied with pression of air

The pump has been elaborately de-scribed by the inventor in a paper pub-lished in the SCIENTIFIC AMERICAN Sur-

RAPID TRANSIT BY RELY CONVEYOR.

with transverse shafts which carry the driving wheels of the platform. The gradation in the rate of speed of the sections of the platform is secured by varying the diameter of these driv-ing wheels, which are a inches in diameter for the Junio 15 inches in diameter for the 5-mile is inches in diameter for the 5-mile platform. The driving whoels are covered with

er, as are the hore guess wheen, and consequently the sin-tion of the platform will be both simpoid and stient. The specemetre sections are coupled together by means of links it inches in length, and the coupling pins are placed at the center, from which the are placed at the center, from warm rae curves of the abutting ends of the plat-form sections are struck, consequently, the opening between the joints may be reduced to a minimum, and a smooth surface presented for walking, with no open spaces to bewilder or trip the pas-

songer

The passenger-carrying capacity of
the moving platform is just double the
maximum capacity of the present Subway trains. According to the figures of way trains. According to the Squree of the Public Service Commission, the total rusb-hour capacity of the five-car local trains per hour is \$2,500 and of the eight-car express trains \$5,000, whereas the moving platform, according to their estimate, would carry 72,500 passengers per hour. They state furthermore that for all distances less than four miles the noving platform is a quicker and more convenient mode of conveyance than the resent local train service and even nicker than the local and express servquiezer than the local and express sort-loc combined, since a passenger may reach Times Square Station, from any local station south of Fourteenth Street (that is, supposing a moving platform were installed on a north and south avenuo) quicker by the moving platform than by the local and express trains of

than by the local and express trains of the present fishway. In conclusion, however, we would sound a note of warning with regard to the possible interference of any moving platform solway that may be built with any future extensions of the present Sulway In selecting the routs, care should be taken to choose a focation muonic per taken to choose a location where the moving platform subway will not block any of the future through lines which must ultimately be built on practically every avenue in New York

Why are We Right-Handed!
(Concluded from page 261)
the lesion on the right side. The hand
and arm centers in the hrain are inti and arm centers in the hrain are inti-mately linked in the cortex with the matery inked in the correx with the speech centers. And certainly Crichton Browns is correct in the inference that the preferential use of the right hand and arms in voluntary movements is du to the leading part taken by the left brain "We could not get rid of our right-handedness, try how we might, it is woven in the brain." And this, I beis woren in the brain." And this, I be-lieve, is the conclusion to which we must scientifically arrive "In the curious dis-same aphasia, in which one forgets words, the lesion lies in Broca's convolution, one cannot say cup, for example, though one sees a cup, but when the right hand touches the cup, the patient at once ut-

Here one reflects ovolution, did the heart tend to be on the left side, and the left brain tend to greater development, because the right hand same to be the most need? Or did the right hand come to be most used, the right hand come to be most used, because of these heart and left brain phe-nomena? I am, for my part, of the for-mer opinion; the heart on the left side, and the greater left-brain development, are effect rather than cause, coming gradually to pass as man, in the strug-gia for the survival of the fittest, found right-handedness more and more advan-

right-handedness more and move tragerons.

Of course, there are professions and trades in which to cretain amount of amiddenterity is essential. For example, the plants in playing the fugues of Bach, must produce with the left hand shows the same tones as does the right, and has to work a tittle harder too, for the bean rotes of the plane are more titleitly wired than the troble. A certain amount of ambidecterity is essential in the surpson. Tet this gift has its disadvantages, within its when colleague shiftled in this way destined to me that the contract of the colleague shiftled in this way destined to me that the colleague shiftled in this way destined to me that the colleague shiftled in this way destined to me that the colleague shiftled in this way destined to me that the colleague shiftled in this way destined to me that the colleague shiftled in this way destined to me that the colleague shiftled in this way destined to me that the colleague shiftled in this way destined to me the colleague shiftled to the colleague shiftled in this way destined to me that the colleague shiftled in this way destined to me that the colleague shiftled in this way destined to me that the colleague shiftled to me that the colleague shiftled in this way destined to me that the colleague shiftled to the colleague shiftled the colleague shiftled to the colleague

time in wondering which hand he d employ. But it is rarely really

Finally, it may be objected, in favor of general education in ambidexterity Suppose one loses his arm, and that such uppose one loses his arm, and that such in unfortunate be a clerk, who must arn his living by writing Such con-ingencies are almost as rare as the amous one by which Mrs. Brown justi fied to her husband her junk-shop pnr-chase of a hrass sign stamped "John Jones, Undertaker" "Our daughter with soon be of marriagable age, she may marry an undertaker whose name man marry an undertaker whose name may be Jones, possibly John Jones, think how handy the sign will then be" In those rare cases of right handed mutila tion there will in time follow, through education and practice, an adequate de-velopment of the right brain, just as if the unfortunate had been left-handed

TREATMENT OF STEEL INCOME.

(Concluded from page 262) remains that hy doing so Riemer has been able to demonstrate his success in pipe elimination on a considerable and commercial scale. A large number of steel shafts, the steel for which was made sited shafts, the steel for which was made by this process and with which the dis-card was kept at 10 per cent or ices, have successfully passed the British Board of Trade requirements. Indeed, a reference successfully passed the British Board of Trade requirements. Indeed, a reference to Fig 1 shows an inxet, treated by this method, in six transverse slabs on the right and left. The slab shown on the upper left hand came from near the top of the ingot The iongitudinal slah to the right of the center of the figure is from another ingot treated by the same hot-top procedure. The inconsiderable depth of the pipe seems pretty evident It extends perhaps 10 per cent of the total length But the actual percentage of steel involved is avidently much less 10 per cent of the total have in Figs. 2 and 4 two views of

the gas furnace There is an eye at the top which facilitates movement of the apparatus. Through two pipes—seen to advantage in Fig 4—the gas and air enter The air is under pressure In the furnace may be employed as a mean of heating the top of the moid prepare tory to teeming the steel into it. then be let down until its lower edge is well inside the mouth of the moid, when the pouring of the steel may be performed without removal steel may be performed without romova-of the turnate. There is thus ample op-portunity to begin action without delay However, it is regarded as important to have not only prompt application, but an intense heat at once. This requirement in tense neat at ourse this requirement is met by preheating both gas and air In fact, heat may be applied in such in tensity as to raise the temporature of the of the logot above the point of fa-It has been found nunecessary to rolong the treatment until solidification completed. This is a favorable item, is completed. This is a favorable item, as thus the apparatus is released for other service, to which its portable characteristic of the service, to which its portable characteristic of the service is not possible to the first the third product is in the service in the service in the service is not service in the service is not service in the service in the service in the service is not service in the service in the service in the service is not service in the service in the service is not service in the service in the service in the service is not service in the service in the service in the service is not service in the service in the service in the service is not service in the service in the service in the service is not service in the service in the service in the service is not service in the service in the service in the service in the service is not service in the servic not outy to conserve the heat of the mol-ton steels, but also to prevent heat loss by conduction from the gas fames. The furnace is being used in Fig. 2 for the purpose of preheating However, the in-got is, in this case, said to be present Now in all procedure for the elimina-tion of the nine we must at seath and

Now in all procedure for the elimina-tion of the pipe, we must act reach final conclusions as to their success without inquiring as to the segregation. The seg-regation is a locality where the steel has an access of carlon, supharp, hosphorus, etc., beyond the average contained in the inget as a whole. Ordinarily, it should be removed. As it is unsulty localities that of the coupling the larget a little below of by cropping the larget. Still below that poths. Element, it is well to inves-

Pompeiian **Bronze**

Permanent Screen Wire Cloth

Window screens filled with this ma-terial will last a lifetime without painting or repairs.

Made of an alloy containing over 90% pure copper—it is Weather-proof— Climate-proof—Rust-proof—and Wear-proof.

The color of Pompeiian Bronze is permanent. It is peculiar to the material—not a coating.

The value of this material for use in sea shore and lake side cottages cannot be over-estimated.

If you are going to build, or rescreen, specify

Pompeiian Bronze

Ask your dealer for Pompetian Bronze. Specify and inset on it for all the screens you ofer. All sizes of mesh, all weights. Most Hardware Dealen have it. If yours hand, don't take any other. Write our nearest branch. We'll supply you direct and guarantee a subfactory numbers.

tigate this question with some thorough ness, as the mothod of treatment itself may, conceivably, introduce variations from the rule Sivel of uniform compo-sition is wanted An ingut cast by the sition is wanted An ingot east by the holotop process was investigated as to its composition. The average carrion con tent should have been 0.2 is per cast. By taking samples along the axis all but one were found to contain carbon in per-centages running from 0.23 per rect to 0.35 per cent. The everyation was close mader the tail of the pipe. Its carbon mader the tail of the pipe. Its carbon percentage was 04i per cent. Similar results were found for sulphur and phosphorus. Thus they existed in the segre-gate in percentages about three and one-half or four times what they did below it.

EGGS OF CURIOUS FORMS.

side the extinct Madagasear hird, the Epyernis, which measured more than thirty inches in its smallest circumfer-

The amailest birds' ages are those The smallest birds' aggs are those of the minute species of humming birds, which are smaller than the eggs of cer-tain kinds of tropical beeties. But the common cuckoo lays the relatively smallest egg That is to say while the jack-daw and the cuckoo are about equal in size, the formers egg is five or six times larger than the latters The fact that the cuckoo is wont to deposit its eggs in the cents of birds which are usually much smaller than itself doubtless accounts for this The relatively largest egg is laid by the kiwl, a strange wing-less New Zealand hird The egg is no less than five inches long, aithough the ex-treme length of the bird itself is only twenty-seven inches.

Reptiles eggs are not very attractive

objects. In the case of crocodiles and many kinds of tortoises they are paiecolored or white, and resemble those of birds in shape. But the egg of the gepher tortoise is remarkable for its complote roundness. It might wall be mis-taken for a golf ball! Many snakes eggs are soft skinned, brown as to color, and look for all the world like a number of ew potatoes.

new potatoes.

The reggs of fishes are usually small, soft, and inconspicuous. The most remarkable polot about them is the extraordinary number laid by the individual. A single cod for example lays as many as nine million eggs. But a strik ing exception to this piscine rule of numarous inconspicuous eggs is seen among tha sharks and their allies These "tigers of the sea" ky eggs which are large in size, few as to numbers, and doposited singly instead of in masses. These eggs. or which several examples are known in the accompanying photos, are known to flaherfolk by auth names as 'play purses' "fairy purses,' or "mermaid's pursos." They consist of a dark-colored, leathery suvelope, and are usually adorned with frills, horns, or long twistadorand with Irilia, norms, or long twist-od tendris. These appendagos serve the purpose of kouping the CRR came aup ported among the branches of neaweeds, thus preserving the embryo from the damagen it would assats were the "purse" curried hither and thither by

Amphihians-frogs newts, and the like —lay fish-like eggs without exception The Surinam toad, however, has a re-The Surinam tond, however, has a transmission of dealing with the eggs whose they are laid. The male takes the issue one by one, and imbest them in the degree of the suring the suring the suring the suring the suring the suring tonds hatch. There may not some suring the suring tonds hatch. There may be as many as one hundred and irectly cells in the back of a single individual core in the suring the suri nore common number

The egg laying habits of the "midwife" frog of Europe are almost equally curi ous. The eggs are deposited by the fe-maie in the form of long chains which may be upward of a yard and a haif in length These chains are taken by the male and wound around his legs and (Ooncluded on page 270)

im the seasoner, after rough weather, may often be seen an object which hears uo small resemblance to a cluster of uproje grappes. This is a mass of cuttle fish eggs—that strange, eight-armed molluler which disports itself in the waves to the undoing of such marine creatures to the undoing of such marine creatures as are unlucky enough to come within grasp of its suckers. Each "sea grape" is produced with a featble stalk, by means of which it is joined to its felmeans of which it is joined to its fel-lows, the whole mass being fixed to some stationary object, euch as a rock er stone But like the eggs of so many ma-rine creatures, the eggs of the cuttle are rane creatures, the eggs of the cuttle are at the mercy of the elements, and in times of tempest they are often torn from their moorings, and cast bruised or broken upon the shore. Near relatives of the outtle are smalls

and shellfsh of many kinds, and among this great group of animals' eggs so many strange forms are found that a description of them would fill a bulky volume Many of the large land mails produce hard-shelled eggs, differing little in appearance from those of birds. An example is the West Indian Bultsus. and shellfish of many kinds, and amone rample is the west indian satisfies, shown in the annexed photograph, to gether with its white, clongated egg But the egg cinster of the common whelk (Bucrinum) is like a rather dingy he comb, partially squeezed between hands. When the eggs are alive hands. When the eggs are alive and healthy, the form of the young whelks can pishinly be seen through the semi-transparent substance which envelops tham. Another quaint form of molius-can eggs is that produced by the intract chelifish (Turrei-rilo) The eggs are joined logother like a number of small beads on a fexible cord

Johns to operater the extension of money of model on a few portion model as are varied in appearance, the eggs of insects are the indictly more so. Moreover, many of them are marvelously beautiful in form and embellishment This beauty is almost always hidden from the eye unaded by the microscope, for the eggs of most insects are more specks, often less bulky that a grain of sand Who, for instance, would expect to find beauty the end of the eggs of many butterflies and moths—mere stoms laid upon a leat—ene stoms in the egg of the most of the south. above that of the ostrich One ponders npon this strange problem without gain-ing enlightenment. Why this delicate ing enlightenment. Why this delicate inserverk? Why this flower-like elegance? Above all, why adorn at all objects of such extreme minuteness? The smaller the object, the greater the care Nature seems to lavish upon it. An example of the fact is found in the case of eggs laid by the minute insects which spend their whole lives among the feath ers of birds. These minute beings pass under the unsavory title of "lice" Yet under the unavory title of "iles" Yet their eggs, when megnified, exhibit an amusing diversity of form and a beauty quite fairy like Tbey are among the most popular of microscepic objects. In conclusion it may be said that cer-tain insects deposit their eggs in clus-ters which bear no little resemblance to

nuts or fruit Such is the case with the "rear-horses" (Mentider) and their allies. Possibly this resemblance may be of im-

portance in protecting these eggs from the attacks of insectivorous birds and

Comets Expected in 1810, The present year promises to be pas ticularly rich in comets. Four comets those of Winnecke, Daniel, Halley, and Inness, have been or are already visible.
Inness's comet, which was very@right, appeared suddenly, it will be recalled, in the midst of a recent auroral display

four, seven periodic comets are ex-te return in 1810. Probably not ly not all o these comets will be visible, because at will be unfavorably situated with rest to the sun at the time of perihelion pas-sage. The expected comets are the fol-lowing '1 Giacobini's comet, 1896 V lowing '1 Giacobin's comet, 1895 V II was first thought that this comet would reach its perihelion about the middle of February, but later calculations have proved that it really passed its periheproved that it really passed its perihe-tion last December It has not yet been seen and, as its position is very unfavor-able, it may escape observation alto-gether. 2 Swifts comet, 1895 II Thie comet was not seen at its return in 1902, and unless its orbit has been considerably changed, the conditions for its ob-servation will be still less favorable this severation will obtain less tavoranic this year it should have passed its perihelion about the end of Jaunary, and should theu have been almost exactly behind the sun 3 The second periodic comet of Tumpel should reach its perihetion about February 21st unless its orbit has been greatly changed since 1904, has been greatly changed since 1904, when the comer was last seen. The conditions for observing this conset in its perited on passage this year are, how see, very unfavorable as, like Swifts comet, it is simused behind the sun. 4. D'Arrori's comet was seen for the first limin is 1871, it was expected to return in 1804, but was not observed, sell in 1804 but was not observed. in 1904, but was not onderved, weing to unhavorable conditions. This year, if its orbit is not changed, it will reach tits peribbilion in Octobr its position then will be very favorable for observation, so that this comet will probably be visible next summer 6 Spitalors comet, visible next summor 6 Spitaiers comer.

1890 VII escaped detection at its visits
in 1897 and 1903, because of poor condi-tions for observation Dr Hopfer, of
Tricate, has shown that the orbit of this comet has been greatly altered by per-turbations caused by the influence of Jupiter between 1890 and 1903. In con-Jupiler between 1890 and 1997 In sequence of these perturbation, the periodic time of the count has been lux reased from 6.42 years to 6.82 years. The counts of the count of

Moving Picture Moyaltics, The moving-picture industry is on a distinctly theatrical basis it has its "trust," its theaters where actors play before a camera, its scene shifters, its supernumeraries, its property men, and a whole theatrical staff more or less simi lar to that of the regular theater The
"trust" in question was formed about a
year ago by a number of manufacturers
of films under the title of the Motion Pictures Patents Company Patents, chiefly those of Thomas A. Edison, were chiefly those of Thomas A. Edison, were pooled, and active steps were taken to purge the moving picture theater of some of the more objectionable pictures which have brought down a hail of criticism upon the industry, to license the moving-picture theater to use the apparatus and exhibit pictures, and to control the inexhibit pictures, and to control the in-dustry in general. There were many in-dependent manufacturers who refused to pay royalties or to acknowledge the patent rights of the Motion Pictures Patents Company A suit was recently brought by the company against Car Learnine, a well-known manufacturer, and the Independent Moving Picture Company of America, of which he is president, as well as the Pantograph C president, as well as the Pantograph Com-pany, to restrain the alleged further in-fringement of Edison patents controlled by the Motion Pictures Patents Company. Insamuch as the patents in question had already been adjudicated and their va-lidity upheld, an injunction was granted The hearing brought out some very steresting statistics, which will undoubt edly open the eyes of the gener (Concluded on page 271.)

or five million persons attend the thir-teen thousand moving picture shows of the United States. The pictures which the United States. The pictures which fileker on the acreen before the speciators are projected by means of apparatus, the basic patents of which were taken out by Thomas A Edison These four or five million persons, therefore, unwittingly pay royalty to Mr Edison whenever they hand in their nickets or their dimes at the box office. It is stated that about 1 440 000 feet of film are may by the members of the Motion Pictures Patents Company On this production a royalty of half a cent per foot is paid to Mr Edison, so that his revenue from the moving picture-loving public amounts

the moving picture-loving public amounts to \$7,200 per week The action was brought by the vic-tion Pictures Patonts Company to re-atrain infringement, but the defense set arain infringement, but the defense set up was that the company violated the Sherman antitrust law The decision handed down by Judge Noyes of the United States Circuit Court was that the question at issue was patent infringement and not violation of the antitrust law, for which reason he granted the

The Brennan Mono-rail (ar.
A auccessful demonstration was given recently at New Brompton, of the Bren nsn mono-rail car At the trial an 80 horse power generaling set was working The trials commenced with running the vehitle loaded with packing-cases, round the circular track of 105 feet radius at a speed approaching 20 miles an hour The stability of the car under these condi-tions was apparently all that could be tions was apparently all that tould be wished, the vehicle canting over several degrees toward the center of the circle of track. This demunatration was fol-lowed by an exhibition of the facilities afforded by such a par for unloading The vehicle was intentionally titled over on to checks on the right-hand side and note isses unlosted it was then righted and then illicit over toward the left atde and other cases un loaded, being flusly righted again, all loaded, being finally righted again, an these operations of thining and righting heling performed solely with the assist ance of the gyrostope gear. The next irial consisted in carrying passengers round the circular track About fifty pas sengers were taken at a time, and several complete circults of the amenighth of a mile track were made with each load During these runs we timed several During these runs we timed several rounds at species of between 18 and 20 miles an hour. The motion on board was quite phasant the vehicle riding very well. The inward cant that the vehicle acquires when traveling on curves at high speed naturally added to rather than detracted from, the comfort of the passengers Attogether same 300 persons had an opportunity of being on the car riages under these novel conditions. The demonstration which followed showed demonstration which followed showed the ability of the vehicle to take sharp urves, this, however, revealing nothing more than was evident from the earlier trial toward the close of last year. The trial toward the close of mar year the carriage, with passengers on board, was then run backward and forward nt as high a speed as was practicable along the straight with perfect success. The alight lateral awaying under these conditions was quito casy, and free from jerk and lotts, and not at all unpleasant. Th oscillation is of very small amplitude, as the controlling action of the gyroscopes

A compound of six parts lard and one part roain is given by the Brass World as an efficient protection for pol-ished steelwork from rust. The two inthe mass from becoming rancid, and stirred until cold. The rouln prevents the mass from becoming rancid and also acts as an air-tight film. If rubbed upon a polished steel surface it executably preserves and projects the polish.

REMINDER BULLETIN

A Boon to the Busy Man

The use of the most modern type of speed-making locomotives, coupled up to the best type of equipment and guided by the most vigilant management makes railroad travel secure and prompt

The time of a busy man is one of his assets It means either gain or loss to him.

The certainty of figuring his time in transit to the exact hour relieves his engagement list from entanglement. The telephone may make the en-

gagement, the train will keep it. The Pennsylvania Special follows up the telephone message. It brings the two ends of the wire

together and consummates the meeting between working hours

The man with business connections in New York and Chicago can lose no time by traveling on the Pennsylvania Special. It runs while the desks are closed.

Pennsylvania Special (18 hours between New York and Chicago) leaves New York 3.55 p. m. Downtown Tube 405 p m. and arrives Chicago 855 a m

Over five hours for business to 245 p m when it leaves Chicago for the East and arnves in New York next morning (Breakfast on the train) at 9 45 a m

You Know the Horse-Power Of Your Engine— Do You Know the Steam-Power of Your Coal?

"—And Steam Power is but another term for 'Dollar Power.'" This doesn't mean the quantity of This doesn't mean the quantity of coal you get for your money—for there's many a culm bank to be had for the hauling. It means that the money value of coal is determined by the amount of steam that coal will produce.

The heat-producing steam-making efficiency of coal is a question that should be settled before the coal goes under the boiler. It is a

problem the Pennsylvania Coal and Coke Company settles for every user of Pardee Coal.

Not by guesswork, not by the eye or hand is it settled, but by accurate scientific determinations of experts who are constantly at the service of consumers. In

Recording Thermometers

F BITUMINOUS 💽

you are assured the fullest measure of efficiency from every ton because Pardee Coal is all mined from the same basin and runs practically uniform. This uniformity means dollars to the man who pays the bills. Knowing your coal consumption, you can order Pardce

Coal by the calendar.

Pardee Coal is low in sulphur and ash. It is economical.

The services of our mechanical engineer or chemist are at your disposal without charge.

THE PANAMA CANAL AS AN INVESTMENT ONSIDERABLE doubt is being expre ONSIDERABLE doubt be being expressed just now as to whether the Franca Canal will prove to be consucretally a paying investment and in a series of articles, which have recently been jublished Admiral Evons, proceeding siong several rather formidable lines of argument, is sut to leave, at the first reading, a depressing conviction that this great national undertak

pressing conviction that this great national innortant ing can never be self-supporting.

On the other hand, there is the fact that other great canals, such as that at Bucz and the one with his made. Manchester a seajort, were, during their construction, the subject of similar dismai foreled ings Yet Suez has proved to be one of the most profitable commercial undertakings in the history of the world and the Munchesier enterprise, in spits of the few lean years of its curiler op ration is now ac-

complishing sil and more than was promised

it is well to remember, moreover that the admiral s presimistic view of the future is based upon a comsilson of the sailing distincts between tertain trad centers and the two canals and he assumes that upless distances via Panama are shorter than those over the transfer variety and the present route, the new waterway will be power-iess to divert calcing trade from its present fluos of estiling. Now although the principle as fire tall down is broatly current, it should not be forgotten that the connecting of the two great oceans is certain to materially affect the trade conditions along the whole stretch of both the Aliantic and Pacific scaboards of North and South America Indeed, the cutting of the canal may so cularge the tinde and importance of certain of the maritime cities as to render it expedient for shipping which at present uses the Suex Cansi route to iske the longer route by way of the Pannnia Cunal

Pannia Canal
But we should judge of the value of the Panama
Canal rather from the military than the connected
point of view—a fact which is well understood at
Washington where undoubtedly it acted as the con-Washington where undoubtedly it acted as his com-pelling motive in urigin Congress in underlyke this stupentous work. That if 4 mil utile trip of the battle-ship Oregon during his spinnish was was not help lesson, the significance of which has user bern for-gotten. The opining of the canni will render the whole naval force of the United Sintes available in there exem in its ability is eatile a rapid and de-tirible covern in its ability is exiting a rapid and deeither ocean in its ability to strike a rapid and either locality blow at any threshood hint stong the whole of the linite! States senboard the efficiency of our feet will be practically doubled, and the fact that the whole any can in a few weeks thus be assembled in the Pastife Ocean will onermonisty increase the neval provites of the lutted States in the Orient and must inevitably tend to preserve the peace in those must the various program of the program the least in those great Oriental questions which begin to loom so large on the diplomatic horizon. So long as the lathmus of Faunan exists as a barrier between the Allantia and the Pacific we must build at least three intitivalities where others so we would build two, and the first cost where otherwise we would build two, and the first cost of construction and the heavy cost of maintenance and one ratios will for exceed any temporary or even prunnent defail which may develop in the operation of the causi as a commor ial venture

Meanwhib umby the administration of that most ficient lasts, the Corps of Engineers of the United States Army the execution of the work is proceeding a rapidity which is in pleasing contra confusion and disempointment which marked the earlier veers of American occupancy and in the series of striking illustrations of the work which we series of striking illustrations of the work which we present in the present lessor, we are emblied to give our readers an adequate impression of the magnitude and solidity of the permanent works, the most monu-mental concrete structures ever attempted.

RELATIVE REPAIRS ON WAVY-BUILT AND CONTRACT-BUILT SHIPS.

HE wisdom of the policy of huilding at least HB vision of the policy of building at least a small portion of the new ships of the newy at our leading early yards has been and is division of opinion. The principal argument in favor of this policy is that it becomes possible to maintain an adequate force of akilled mechanics permanently at the yards, and avoids that disastrons breaking up the yards, and avoids that disastrons breaking up of the organization and scattering of forces which oc-curs in the slack assess when the annual repairs upon the ships are completed and they have sailed cura 1 for the summer maneuvers. The maintenance of a permanent force increases efficiency and insures that permainent force increases efficiency and maures that the leading yards will be in a position to meet at once the besvy strain which would be thrown upon them in the event of andden bostilities. Of equal import-sance to the question of the effect of new construction in maintaining a permanent force in the navy yards is that of the character of the work that they that of the charatter of the work that they can turn our Conclusive data upon the subject are furnished by those two sleter ships the 'Connecticut' and the Louisiana the first built at the New York navy Jard, and the latter by the Nawport News Shipbuild ing Company if certain disabilities under which ing Company If certain disabilities under which the navy built ship labored, due to slowness in the de livery of armor and the fact that she required special fittings as a flagship be considered, the time and cost fittings as a figgship be consultared, the time and cost of construction may be regarded as approximately the same as those of the ship built by contract. As to the question of the relative quality of the work done, there is no surer test of

of the work done, there is no surer test of this than the amount of respire which have been nude upon each vessels in the four years that they have been in commission. The following figures, taken from the report of the Paymanter-General 1906, their first year of service, the requires on the 'Con-tent of the content of the paymanter-General 1906, their first year of service, the requires on the 'Con-tent of the content of the paymanter of the paymanter of the content of the paymanter of the paymanter of the amounted to \$43.574.74, and on the 'Louisiana' to 89-4. 871 09, and the totals up to the end of the fiscal year 1909 were, for the may built ship \$111,833 58 and for the contract built vessel, \$149 167

In view of the first that during these four years the cost of the repairs for the Connecticut' was about if per cent less than that of the Louislana" what be of the oftrepeated alatement that our yards are incapable of turning out work of the same high quality as that of our private yards?

THE REED OF AN IMPROVED PARCELS POST

HM existing restricted parcels post system of the United States Post Office, as established the United States Post Offere, as established by Congress in 1874 has so far Flutted the casy exchange of commodities and merchan dise between manufacturers and consumers that it is making the United States appear to be wonderfully behind the times as congared with some foreign ma-tions, such, for instance as Engiand France and Cermany 11 is a fact today that an American in Germany. It is a fact to-day that an American in haginard can send home by mail to any part of the lutted flattes in sparred weighing two and one half times more than he intuel flattes limit for about conscibing loss in cost than the present home rates in above words the world pound union package unit is selven pounds to the parcel at the state of twelve cents per pounds to the package at a cost of sixteen cents to the pound. The parcel rate of twelve cents per pound to the package at a cost of sixteen cents to the pound. The parcel rate cost of sixteen cents to the pound. The parcel rate cost of sixteen cents to the pound The parcel rate cost of sixteen cents to the pound. The parcel rate cost of sixteen for the cost of sixteen rates to the pound the parcel rate cost of sixteen for the cost of sixteen rates to the pound the parcel rate cost of sixteen for the cost of sixteen rates to the pound the parcel rate cost of sixteen cost of the cost of sixteen rates to the pound the parcel rate cost of the cipht ceals per pound for a package insured to a weight, but for vorpounds. After that the rate was quistle, but the weight remained the same Bince 1876 the cost of temperature has greatly decreased. The question is, who should not the public through its representatives in Congress to given the besself of this decrease. The presentatives in Congress to give the the selfs of this decrease the property of the establishment of a uniform low postal rate for parents that will oncourage the use of the Post Congress that will oncourage the use of the Post Congress as medius of exchange of commodities, and thus results fortilists trades? rally facilitate trade?

Since the experimental introduction of the Rural Free Delivery system in this country, its operation has proved so great a accessity, convenience and succe ress overlooks the annual deficit arising fro the unreasonable restriction placed in the law lim ing the kind of postal matter to be carried to letters, newspapers, and periodicals. The weight of this avernce load is acceptained to be but twenty-five pounds per trip while the vehicle which the postal agent is required to supply can readily carry two hundred pounds it is estimated that should the restriction be removed and parcels be carried, even allowing only one or two parrels per trip, anough revenue would be re-ceived from the additional postage to more than pay the total cost of this system, and make it self supporting

ent in this direction is the intro a hill before Congress, prepared by the Postal Progress Leagus known as the Bennett Rural Parcel Post Bill, now in the House Postal Committee, which provides

for very moderate postal local rates along, between the city or town and places in a country 1t would enable the merchants mercial center to send, say on telephone en supplies directly to the purchaser niving on and would promote the exchange of merchan tween the residents themselves on the route, as their sending products to the commercial the service would be somewhat similar to the usual postal railway coach and its collection and tribution of mail matter

tribution of mail matter. With the extension of good roads and the use of rapid automobiles, a longer route could be established than now exists, as a maximum distance, which would reduce the number of vehicles required and economise the cost of maintenance

in this connection the experience of the use of the in this connection the experience of the use of the mail automobiles in London is worthy of note. At the second annual dinner of the Royal Automobile and the sociated Clubs of London in the summer of 1909, Bir Henry Norman in a speech alluded to the successe of Henry Norman in a speech alluded to the success, of the mail automobile as a time and money saver is the transportation of mails, by saying that in the sity there were thirteen local motor services averaging thirty two miles a day. There were also ten sets as services in and out three times a day between London principal towns on the outskirts of the city. and the principal towns on the outskirts of the city. In the thirtnen long-distance night automobils must coach services a saving of \$300,000 a year was affected as compared with the horse service which did the sams work only a few months before. The London Post Office is now operating no less than sixty of these motor services.

Results of this cnaracter certainly show that the

establishment of n very low postal rate for purcels is feasible since it will treate more than sufficient revenue to pay the cost, besides saving money for the mer-

whue to pay the cost, besides saving money for the mer-chant and consumer

It is to be hoped that Congress will give such intelli-gent consideration to all matters relating to postal im-provement that the system, so useful and necessary to the people, will forthwith be placed upon a sound busi-

HYDRAULIC TURBING REDUCTION SEAR.

NY TORAULO TOWNITE REDOCTION SEAD.

If the issue of the SHUTTHO TION A WALLAY OF February 17th of the present year, we described the turbins reduction pare designed by McFarland and Maripine in which a mechanical gearing is in irposed out the shafting between the turbine sand the proposity. For the purpose of reducing the economical bight speed of the former to the relatively low economical to the control of ong a speed of the former to the relatively low eco-nomical speed of the inter, and it was noted that a mechanical efficiency of 985 per cent had been secured in the shop tests. Simultaneously with the developat of this gear, the problem was attacked by Dr H inent of this gear, the problem was attacked by Dr. Hyttinger who, with the assistance of the Valcan Works at Settlin, has produced a reduction gear which substitutes for the toothed gear of the MrFariand system a set of hydraulic turbines through which a body of water is kept in constant it riculation, and by the proper proportioning of whose buckets and channel ways the desired reduction of speed is secured. A complete description of this goar with liturations in the complete description of this goar with liturations in the property of the complete description of this goar with liturations in the complete description of this goar with liturations in the complete description of this goar with lituration of the complete description of the goar with lituration of the complete description of the goar with lituration of the complete description of the goar with lituration of the complete description of the complete reference is made for fuller details than are here reference is made for fuller details than are here given The turbine shaft and propeller shaft are in-dependent Upon the former is mounted a rotary pump, which delivers its water into the buckets of a water wheel which is mounted rigidly upon the pro-peller shaft, and it will be evident that by selecting poller shart, and it will be avident that by selecting the proper relative dimensions of the two members, the desired ratio of speech between turbine and pro-peller can be obtained. In its simplest form the re-duction gaze consists of a pump, gratice channels, and a driven water wheel, but in the larger powers one or more intermediate wheels would be interposed be-tween the pump and the driven wheel, indeed trians-formers with one or more stages are preferable while a considerable reduction of speech is desired. With a reduction ratio of between 1 to 4 and 1 to 6 using two reduction stages, an efficiency of from 80 to 82 per cent is secured. This seems low when compared the 985 per cent efficiency of the McFarland with the 886 per cent efficiency of the McParland spar, but the Corman system has the advantage that it is readily reversible. The system has been tried on a small resed of 787 tens, which has been driven by a 500-horse-power turbine at a speed of between 13 and 13 knots. When the reversing lever was thrown over at full speed, the propolers that came to a stand-ctill in 5 accounts, and within 15 seconds that exquired atti in o lectures, and within 15 seconds and sequitions. An inversed speed of between 900 and 185 revolutions. On the shols, it would seem that the German, because of its low sife-incey, cannot compete with the Ameri-can system on ships that make long continuous voy-ages. On channal and river steamers and for tugs and small vessels it has some advantages.

Asbestine, for Fireproof Costings.—Prepare a past like mass of asbestos, powdered allics, caustle potas and sods-water glass. To be burned and sand mite

NEW TYPE OF TORPEDO BO.A.

A DOUBLE-HULLED BOAT WITH ITS ENGINES ENTIRELY BELOW THE WATERLINE

A new type of war vessel provided for by Congress in the Naval Appropriation Act of last year will be officially tested by the United States government at Bost in within a few days. It is known as the sub-surfa a tope to beat and is designed to be lumnus from the small gun fire now relied upon as a pi tion against ordinary torpido boats. It consists of a a hmarine hull which contains all the machinery and torpid armsment suspended from an unsinkable sur hull divided into compartments packed with

cliut se Last years law authorizes the purchase of this bout when the official trial shows that it fills requirements and the construction under con ty: Ite boat has had a prelim insty trial Tana Lemoine & Cra tle onstiting architects r; ri that it easily n the 18 knots t ir thus exceeding the re-quird speed by 2 knots Bix tons is the weight of the ves-

six tons is the weight of the ves-sel and its length is 46 feet. The tric which life government has age ed to pay is \$22 500. The small subserva to best can either be used for coast defense or they strict on board of the at be strict on board or the intrar vessels in an armored flect in time of a ticn they can be launcied and directed by day or night against tie enemys flect particularly for operation against ships lying under the protection of

land Kriffications or mine fields where expensive lattleships should they were at Manila Santiago and Lort Arthur

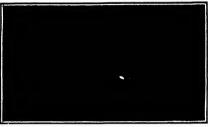

in the submarize hull of the new style boat is an eight cylinder gusoline engine of 1.0 horse-power. The explosive charge carried for use on hostile vessels is 1000 pounds of guacution. An armored couning tower on it surface hull communicating with the submarize hill chables the navigal r t dir of and control the boat s movements. Only two men are re-

It is extimated that a fleet of fifty of these subse torpodo boats will cost about as much as two ree destroyers or submarines. As their cruis surface torpodo boats will cost about as much as two or three destroyers or submarines. As their cruis ing radius is 200 miles their principal fun tion will probably be for the defense of ports and unguarded

surface boat is to be operat The subsurface boat is to be operated in one of two ways I lither it may be stoered within short lorpedorange and almed at its objective the crew leaving it in lifeboats or buoys or it may be fitted with a sub merged bow torpedo tube to discharge the ordinary

For the firing of the high explosive use is made of an electrical firing (ir uit which is actualed by a bow firing pin but which is kept open and safe by a switch in the canning tower until the boat is deserte in the centility tower until the post is deserted at as also prefered to continue the firing (ir uit around the inner skir of the upper buil below the water line so as to explode the charge if the boat should be rammed, deler hoslife boats from ramming Also It is proposed to use on the engine sparking circuit a time swith whi h will automatically break the sparking circuit and stop the engine and boat if it misses its

type is \$46.000. When the first is approved the Nary Department is authorised to contract for two others, one more of the amen sizes and one larger and faster—a \$40.000 subsurtace seagoing destroyer.
A year or two age the Austinat Secretary of the Nary recommended the building of a number of small motor torqued beast of approximately the satise size as this to be laid up on above in peace time for one of the secretary of the se

THE SUBSURFACE TORPEDO BOAT OF ITS TRIAL TRIP

than has been achieved by the present subsurface boat on its preliminary trials

on its reliminary trials
The English motor torpedo boats huilt by Yarrow
with Napler engines make about 18 knots. They are
of about the same stae as the vessel we are describing
and are used for the same purposes. It would appear
therefore that no greet has been into thy carrying the
contines and torpedo below instead of within the buil
of the boat. It is assessment bethef to where of the comof the boat It is suggested that in view of the com paratively small expense several fictilias of these boats could be distributed along our coasts and laid up with the engines greased in which condition the expenses

the engines greased in which condition the expenses of maintenance would be very small.

There can be no doubt that all the navies of the world are just now directing special attention to sub-surface warfare and the trails of this boat which of fore some decidedly valuable features in the great protextion afforded both to the motive power and the high explosive will be watched with no little interest. The general design of this very interesting craft is

due to Cisrence L. Burger OE of New York and the plans (alculations etc were made by the Naval Architects Tams Lemoine & Crane

TRACES ELECTRIC TROLLEY-DRAWN SLEIGH IN NORWAY

BY FRANK C. PERKINS

chiragevice during the past win-

The news construction of the trackless trolley car this A. S. Dommeter Maktriske Bane is shown in

tier ig, Sheweg as "shewes he had been controlled to tracking to the controlled to t

livery winter the demand for fresh eggs becomes more instituted and more difficult to supply Foulity breeders in different parts of the world have en

deavored to supply the deficiency by artificial selec-tion. By this process an Australian breed of fowls which averages 270 eggs per hen per year has already been produced. A series of very interesting experi-ments on the same subject has been carried on during nests on the same sunject has been carried on during the past ten years at Macdonald College, in Montreal, which is reputed to be the most perfectly equipped school of agriculture in America. Starting with hreeds noted for their endurance of cold, especially

A PASSEFER SLEIGE DRAWS BY A TRACELESS SLEGTRIC TROLLEY

Plymouth Rocks and White Wyandottes the experimenters began the process of selection by allowing the fowls to leave the poultry yard and arratch in the anow in the celdest weather The progray of the fowls which availed themselves of this privilege was rows wink a valued teamment of this privince was subjected to similar treatment which was continued for several generations. The poultry houses were not heated, even when the temperature fell to sero Fahrenheit, although the fowls were slightly protected from the cold by scrosse placed around their perchast of the poultry pards were covered with a layer of straw

a foot thick, upon which wheat or millet, the only food a foot thick, upon which wheat or millet, the only food given, was strewn at requiar hours. The bens were kept busy from morning until night in hunting for their food in the straw. This active exercise pre-venied the accumulation of fat and stimulated the production of eggs, for every poultry farmer knows that fat hens are poor layers. Hence, as hens, like all other birds, naturally store up fat at the approach of winter, the problem became limited to preventing this ac-

cumulation of fat, and at the same line ascumuation or list, and at the same lines as-suring to the bens an abundance of food. The problem appears to be in a fair way of solution for the hens of Max donald College produce an average of 500 eggs per year, from one-fifth to one-fourth of which are laid during the rigors of the Canadian

The removal of ashes by conveying them to a waste bank hydraulically is done in connection with the temporary plant built to supply power during the construction of the Rainbow Falls bydro-electric development of the Great Falls Water Power and Townsite Company on the Missouri River near Great Falls Mont The power house is on the side of a hill directly above the edge of the river bank. The bituminous coal on the side of a hill directly above the edge of the river bank. The hituminum conti-used is dumped by gravity from cars on a trestle to a bin at the rear of the firing floor of the boller room and runs down on this floor, from which it is fed by hand to the furnaces As the asies fall through the

the furnaces As the sales fail through the concernite they are drawn out into a transverse concernite they are drawn out into a transverse concernite the sales of the sales of the sales is aloped to no sale of the building, where it connects with a funne extending on a grade of about 5 per cent of the sales are pulled into the trench and a cleaned the ashes are pulled into the trench and a hose stream thread into the latter to start them. They are thus picked up by and carried out in the river through the flume No difficulty is experienced from clouding in the trench or flume and the current in the river prevents an accumulation at the edge of the

THE EARLIEST STORY OF THE DELUGE

PROF. HILPRECHT'S REMARKABLE DISCOVERY

th more so in fact than any or caselform version thus far

One of the meet remarkable discoveries which has ever been made in Amyriblegy, a discovery which resours been made in Amyriblegy, a discovery which resours greatly to the seedle of the University of Pennsylvania and to the evedff of Frof H C Rilprecht, is the indisting of an account of the Babylonian Deluge which antedsites any Debugs narries extant. The significance of the discovery is enhanced by the fact that is the most important designing and the seed in the seed i

FRONT AND ROCK VIEWS OF THE NIPPUR VERSION OF THE DRIVER.

BATE APPROXIMATELY, 2100 R. C.

cued Lot from the hands of Amraphel of Shimar and Chedorisonier of Elam (Genesis 14) Furthermore in its preserved portion it showed a much greater resemblance to the Biblical Daluge story than any other fragment yet published.
The cunelform text of the frag

ment contains a portion of the di Nosh III us plahtim to construct a ship and to save life from the ail desiroying flood. Apart from the tradition of a great flood handed down by the Babylonian priest Berosus (living between 370 and 250 B C) but preserved only in ex tracts by other ancient we there are fragments of three writers tinet Deinge versions in canelform

The first of these is the version from the library of King Ashur banapai (658-626 B (*) which was restored from a number of frag veh. and which is an Assertan con-

veh, and which is an Assyrian copy of a Babylonian original.

The second is a somewhat dif-ferent version of the Babylonian betuge story and is found on Fragment 'D(ally) T(clograph)

42," which likewise came from the royal library of Nineveb and was inscribed about the same time to 850 B C)

The third fragment is that acquired and published The taird regress is that acquired and published by Prof Scholl of Paris, and now in the possession of Mr J Pierpont Morgan It is dated "in the year when King Ammi-aduga at the mouth of the Kuphratos," is a, the elevants year of his government, in other words, according to Prof Hilprocht's reduced chronology, about 1958 R.C.

An examination of the canelform text of the Alpput fragment and a comparison of this new version of

the Babylonian Deluge story with the parallel pas-sages of the two Nineveh versions and the Biblical morr nave brought out the significant fact that, with all due allowance for a general resemblance between the three cutefform versions, the Nippur version of the drine amouncement of a great food and the command to build the ark differs fundamentally from the two Nineveh versions and agrees many command to build the rack differs fundamentally from the two Ninevah versions and agrees most remark-ably with the Biblical story This agreement affects that part of the Pentateuch (Gen 6 13-20 8 11) that part of the Pentateuch (Gen 6 13-20 8 11) which Dld Testament critics style P (==Priestly Code) and generally regard as having been "compiled in Babylonia about 500 B C" The importance of this new text to theological students cannot be overrated Written as it was about 2100 B C, this new version came into being at a time when the sanctuary of Eniii at Nippur was supreme among the Babyionian temples and was the center of literature When Hamnurabl, the Amraphet of Genesis 14 conqueres Sin of Larse, the various petty Sabylenian stat Blu of Larms, the various petty Babylonian atakes con-stituting geographically the speciest kingdom of Buu mer and Akkad were united politically by the con-queror Babylon on the Euphrates became the me-tropolls of the united empire After Ammidilans the third successor of Hammurahi Nippur disappears third successor of Hammurshi Nippur disappears rapidly from history. It respiesars with the rise of the Casalle dynasty in Babyloula about 1400 H.C., and its sanctuary again rises to hold a conspicuous place for several centuries. The revival is but the last

in Prof Hilprechts opinion the Temple Library at in irror illiprents opinion ino remide Library as Sippur was a most insignificant institution after 1000 B C, and it flourished most gloriously before 2000 B C' The priests of the Casalic and No-Babyinnian periods produced few, if any original literary comperiods produced few, if any original literary com-positions of value at Nippur

mere delighting in the state-ment of the end of their tabmen at the end of their tan-faithful copy of an old Nip-pur original. The literary activity of the priests was erred to other centers like Rabyion and Sipper It is therefore evident that the is therefore evident that the Nippur fragments, antedating the two Ninevel versions by 1500 years, represent the old est version of the Baisvionian Deluge story in a Semitic translation, made doubtiess from a much older Sumerian original which has not yet been discovered and that the inter tunesterm versions are different editions of the same story with consider-able changes, abbreviations, and additions The Deluge atory of the so-called "Priest iy Code" must form part of the oldest Iraditions of Is

Even the Amarna period (about 1400 B C) with its unsettled conditions in Pa

line, when the influence of Babylonia upon the shaptine, when the influence of Babylonia upon ine shap-ing of the government and the religious conceptions of Palentine was simost sit cannot explain its pres-ence. In the Old Testament. The only period when the oldest version of the Deluge story could possibly have entered Canaan was the time when Abraham, whom Prof Hiprocht rigards as an historical per whom Prof Hillpreat regards as an ansortes per sonage, left his home on the Euphrates and journeyed westward, in other words, the period of the first dy nasties of isin and Babylon of which Hammurshi or Amraphel is the rentral figure, the lime when the Amorites knocked at the gates of Bubyionia, invaded Although the interpretation of the Nippur tablet

nenns easy it can be stated with safety that is by no n in accordance with the exaited position held by Entil in accordance with the example position from y some in the old Babylonian pantheon as "father of the gods" it was in all probability Enlit himself who warned [1] ne-pitabilit to take refuge in an ark Here then as in the libitest version, the Lord of the Uniin the then as in the Diblical version, the Lord of the Unifrom destruction by warning him and ordering the ruction of an ark

We present herewith in paratiel columns the trans-We present herewith in parallel columns the trans-lation of the actual preserved portions of the ancient Nippur version and the corresponding passages of the Old Testament according to the Rebrew text. The similarity is at once sirking as much so in fact that the blanks in the Nippur version can easily be suppiled by the more complete account

IAL APPLIANCES BY WHICH THIS HUGS ANTIPICIAL

MONORATOR, 400 PROFE WIDE, 4,000 PROFE LONG, AND 30 to 100 FEET DEEP, IS CONSTRUCTED

The work at Panama, and particularly at the great

The work at Panana, and particularly at the great light of double looks at Gatu, has now reached a stage at which the camera is able to catch some advants impression of the titland proportions of the work and record it for the laterest of the outside world. We have all understood that the scale upon which work was being done at Panana was impressionable to the stage of the scale teach us just how stupendous is the mass of masonry which is slowly taking shape near the Atlantic end

The locks at Gatun will pass vessels up or down The locks at Gatun will pass vessels up or down between sea level and the lovel of the lake which will be formed by the great Gatun dam immediately ad joining the locks. The total height of 85 feet will be covered in three flights of approximately 28 feet be covered in three flights of appreximately 25 feet, each, in order to provide ample accommodation for future florense in truchs, and also as a contingency florense to the control of the control of the built in duplicate, as shown in the plans beswith presented Each lock will be 150 feet wide, and will have a usable length of 1,000 feet. To provide against the carrying away of gates and the consequent rush of water out of the lake the former will be built in mum of 18 to a maximum of 23 feet, the size varying according to the number of side culvers that are served. Now it can readily be understood that the coat of a work of this kind, involving the handling of 4,000,000 cultic yards of material, depends very largely upon the amount of labor involved. For in the coat of t largely upon the amount of labor involved. For In-works of this character the cost of labor is the prin-cipal item, and hence much thought has been given to the design of the appliances for handlin in con-crets and the huge "forms (temporary in leating walls) within which the concrete is deposited. At the Gatun locks the sand and since are deposited the Unitude notes too same and sione are especially from cars in a stock pile running parallel with the lock site. On either bank above the buge excavation in which the locks are being built are a series of lofty sixel towers (see front page and Piga. 2 and 7), between which are strung heavy, steel cablos, by which the buckets containing the materials are transported The concrete is picked up by these cables run over the excavation and lowered at the desired point. The first part of the concrete work consisted in

The first part of the concrete work consisted in the laying of the huge slah of concrete, 302 feet wide and nearly 4,000 feet long, with a maximum this knew of 20 feet, which forms the floor of the locks. Dur-ing the construction of this floor, care was taken to provide circular transverse conduits with vertical openings through the floor which led alternately to opposite side walls, there to connect with the main longitudinal, emplying and filling condults. The next task was to erect the side

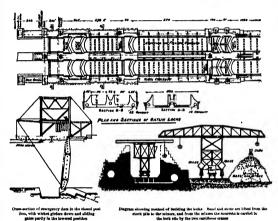

walls, and it is this in-teresting work which is shown so clearly in the tion

The walls are built in sections, each of which is about 40 feet wife, with a space of about 30 feet between them. The wall is then completed by filling in the interveb-ing vertical gaps It is well understood

that one of the most ex pensive elements in con crete construction is the building and manipula-tion of the forms in which the concrete wis in smaller structures those are composed of timber, but because of the huge amount that would be required and would be required and the big depredation in the value of the timber after use this material was situgether out of the question 1 be pisn adopted is shown very clearly in our lilustra-tions. The forms are built entirely of steel (Figs 2, 4 and 5) Those for the liner ver tical face of the walls consist of a sories of massive steel towers of

massive steel towers of trinagular cross-section, to the vertical fare of which is rivered a wall of steel plating, stiffened by herisontal channel irons. The towers are carried upon four 4 short receipt, we under the fresh and two under the read for the first of the four the four the four the four the four the four of the four the fo crossed by a series of separate rectanguist forms measuring about 6 feet on the vertical and 4 feet on the horisontal face. The ends of each wall section are closed by means of sivel plates supported against vortical movable framework into the pocket as thus formed the concrete is dumped from the skips of the overhead cable, and tamped into place by the laior ers, until the full 5 feet of height corresponding to the height of the rear stepping is completed the height of the rear stepping is completed. The walls are thus carried up three at a time until they have reached their full height. This work is very clearly shown in the front page engraving, where a skip is shown as having just delivered its load and skip is shown as having just delivered its load and the laborers are spreading and tamping the concrete To amist in making a firm joint between the mono-lithic sections, vortical and horizontal key ways or pockets (Fig. 5) are formed in the abutting faces, poches (Fig. 5) are formed in the abuting faces, which pockes are, of course, filled in with rescrete as the intervening spape between the walls are built up. This system of keying, coupled with the instural adhesion of the concrete, will prevent any incheaps to creaking or separation of the walls at these points under hydraulir or separation of the walls at these points under hydraulir or search pressure or under the rack ing strains of an earthquain shock.

A most interesting piece of steel form work is that

How the 4,000,000 cubic yards of concrete are being mixed and built into place at the Canal locks BUILDING THE HUGE CONCRETE LOCKS AT GATUE, PANAMA

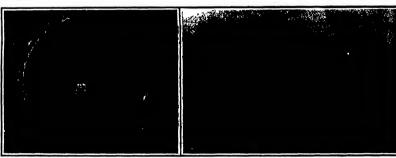

duplicate, with a considerable space of water i them, so that if a ship, overrunning, abould strike the first gate, the second will remain intact. Also, them, so that if a ship, overrunning, about strike the first gade, the second will remain intact. Also, at the entrance to the upper lock, there will be a huge swing bridge which, in the event of the gates being certed away, can be swung scross the lock entrance, and a series of horisontal, vertically sild

being carried away, can be swung across the look cutrance, and a series of horizontal, vertically sild ing steel gates lowered down from the bridge, than dectually skilding steel gates lowered down from the bridge, than dectually skilding and the state shock of a collishen and thus, partially in at along thee, absorving the momentum. But the present story is concerned with the method which have been adopted for building this bege monolithe, or unjointed, mass of artificial manour; into the construction of which will mater about four million cutler yards of concrete in general, the locks and yet the state of t Excel are paid on an incine and are supposed, or berisontal thickness increasing with the depth of wither in order to resist the lateral pressures Possible in suppring and filling the looks a series of transverse collects, formed in the floor, lead to large longitude theat selverts in the base of the walls (Figs. 1 like 3), the later ranging in diameter from a minifor forming the 18 10 22 foot conduits in the side waths 11 consists of a thexibic steel pipe (Fig. 1) heavily braced to redst deformation, while has a longitudinal hinge at the top and at the bottom is provided with heavy left and right see as by which provided with heavy jert and right serves as where the form is kept to the full dimension during the lay-ing and setting of the control. For remove the forms, the serves in turned and the bettom edges of the form are drawn together thus reducing the dimension and allowing the form to be drawn clear of the

conduit
A ment interesting picture is Fig. 3 showing the
work at the entraine to the looks from Caton dam
forth, right is seen the rear stepping of the easterly

wall of the estately lok The circular timber work shows the position of the upper end of the first lock. Just beyond this are two sections of the steel forms for the main central conduit by which water will be left from the lake to the upper lock. Just beyond the wall which extends across the picture to the right hand bank will be located the amergency dan above reterred to, and beyond that will extend the three piers with will form the lock entrance from the lake. The embantment which will be see resulted to the contract of the contract of the contract of the contract of the of the state of the contract of the con out as an extension or the natural mans to the right of the picture is the rock fill forming the south-crip toe of the great Gatun dam, which extends to the right across the valley to a junction with the

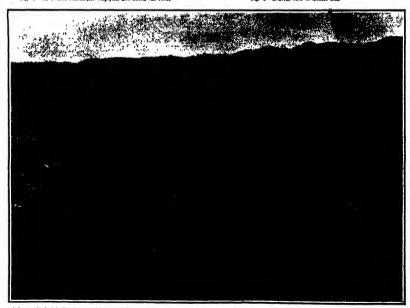

distant hills. The lake of uning uses to the right of the rock embantment is feptical by the hydratile dredges which are being using in making the Gradus with a read of the locks, and the making the Gradus dam. Half a mile to the negrip, also extending across the railey from the northerly and of the locks, as similar rock fill, and hum dredges are now engaged in pumping all and waste from the Chagras and from the various contiguesse channels, into the highest half as mile wide and over a smite long the basin half a mile wide and over a smite long the basin half as mile wide and over a smite long leaving the fine silt in a firmly companed, impressible mass, which is so dense that it will be impossible for the waters of the kinks over to seep through. If the reader have sufficient imagination be can, by

be conduits are furned in the body of the side and center walls. The forma-inguith sire! ryllinders, bluged at the top split at the bostoms and kept in right and left series. The latter are loosened when the concrete has set the two haives of the cylinder to rwing inwardly and he withdrawn

Fig 1 An 18-foot conduct, for emptying and filling the locks

it for diling the looks. Beyond the wall will be the emergency date and the entrance plans, which s too of the Gaten dam. Back of it are the water and sit, which have been

Fig. 8 -General view of south and of Gatan looks

ag at this picture, fairly depict the scene as it appears when the canal is completed, supposing, urns, the side wall were broken away to give him popularisated view To the right the bank will as unpeltracted view To the right the bank will be shat of the best of the walls of the lock structure, and to the left he will set the three concrete piers estanding fine out hint a wast lake of water which will cover shift the space now occupied by tracks, telegraph time and embankments, and will extend in an unbroken eaginee until it reaches the hills in the far distance.

Efficiency of Minim Tarbles Rendes.

Some experiments upon steam turbins nossies, expanding steam from ordinary boller pressures to condenser pressures, are described in a paper presented to the American Society of Mechanical Iong, neeth by Prof. Silbley and T. R. Kemble I he main results are worth nothing, and confirm the inlaim ands for the efficiency of nossies by turbins makers Efficiences of from 90 to 85 per cent were regularly obtained. The actual discharge from the nozzie,

stated as a percentage of the theoretical discharge, was of the same order as the efficient less. Most interesting however, was in apparent tack of influence excepted by the form of the housile even when this might have been expected to be considered, as, for instance, when the section, changed from it cuits at the neck to square at the disk major or when a conical noedle protrusted into the norrie from the latter and Smoothness of surface was, however, an important factor

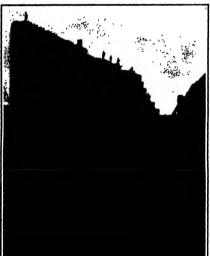

Fig 4.-Steel forms in place for building center wall,

The gaps will be filled with concrete, keyed and comented firmly in place, thus providing a con-tinuous monolithic wall. The steel angie plate forms are already set up across the further gap Fig 7 -Sections of easterly side wall, upper lock

HE HEAVENS IN APRIME

BY HENRY NORRIS RUSSELL PH.D.

E great conkt which was so can apicuous in January is again observable in the morning sky, just infore daylight but only with telescopic aid Its orbit is now well determined and it apnow well determined and it ap-pears that it was nearest the sun, at a distance of 10,000,000 miles, about the time of its greatest brightness, and that its

and fading was due to its steady recession from and roung was due to its sleady recession from both anth and sun its orbit is probably very nearly peraboth. That it could not be of short period was clear at the time of discovery for so bright an ob-ject could not have eastape being seen often before, if it had come around at moderate intervals like Halley's comet

The latter is invisible behind the sun during the early part of April, but is well placed for morning

time it appears almost statime it appears almost sta-tionery in the heavons south of the eastern edge of the great square of P games and in high crough to be observed be-for 4 A M its distance from 168,000,000 rolles on the state of 77,000,000 on the 5th and the squarent size. With and its upparent also as d brightness will stead-ily tucrease By the end ily increase By the end of the month it will doubtless be conspicuous to the naked ove

While waiting for this, we will find abundant ocrupation among the stars. Hefore we trace out the Hefore we trace out the constitutions into which the imagination has grouped them, let us study a real family of stars, whose relationship has but recently been discovered. It has stready been told in these columns how Prof. Boss has identified

about forty members of a group of stars in Taurus which are keeping to-gether in their movement through space like a flock

of wild grose in the air

It has also been known
for some time that five of the bright stars of ti Great Bear form a similar group, and recently, German astronomers, i,u-dendorff of Potsdam and Hermprung of Göttingen, it has been found that several other conspicuous tars, in different parts the sky, also belong to it. All these stars are really moving in the same direc-

moving in the same circo-tion, and at the same rate, and hence they all supear to be moving away from the same point in the heavens, though in quite different directions, for some pass our system on one side and some on another. They

though in quite different directions, for some pass our system on one side and some on another. They ought on this hypothesis still to be approaching un, and the spectrosops shows that this is actually the case the observed varieties of approach agreeing. The stars of this ayeine are shown on our map First comes the group in Uran Major—the stars for, and, all if in the Great Disper—with Alery the small companion of Missr (2), and also two other stars not shown on the map, one of them should take the stars of the system of the same of the stars of the stars of the system of the same of the stars of the stars of the system of the same of the stars of the stars of the system of the stars of the stars of the star in the star of the star in the star of the star in the star of the star of the star in the star of the pointed out by a line from # through & Urse Majoria,

carried as far again. The other stars of the group are identified by the fact that their apparent metions are also directed away from this point, though they are also directed away from this point, though they are widely scattered over the sky Two of them are nearly in line with the stars of the Dipper, though far removed on each side—\$\beta\$ Aurigas and a Corona. The former is the removant of the group, about 10 light years away, while the latter is abo

as those previously described

Parther southward, in quite a different direction,
is the star & Leonis, whose calculated distance of 39 light-years puts it much nearer than these others, and suggests that direct observations of its parallax and suggests that direct observations of its parallax would be desirable Finally, and most remarkable of all the splendid Birius is undoubtedly a member of the same group it owes the brightness to its rela-tive neuroness to us—only \$1/2 Light-pears according to the demands of theory which in this rame is con-firmed in a most satisfactory way by direct obserwe may fix our eyes first on the N tle Bear, to which this belongs, w the Bear, to which this belongs, while most conspicuous groups, is easily type a tolerably good "Dipper," though less phrase may be pardoned) than its in The figure of the Bear, as shown in chardiy be made out except that the life to the Dear water which water wat ing in Polaris makes quite an u Polaris itself, spart from its positions as a double star, observable with as a double star, observance warm while the spectroscope shows that it the two is attended by two invisits with a period of less than three da more remote, with one of several Around the Bear coils tha Pro-

NICHT SKY: MARCH AND APRIL

When the actual brightness of the other stars of the system is computed it is seen that fiftrue is actually one of the fainter members of the system. Its total light is about thirty times that of the aux while that of the Pflacenia stars of the Dipper and of α Coronae averages fully twice as much, and that of a Aurigas is about ion times as meat. Delit Lonis, on the other hand, is only about ten times as brightness on the other hand, is only about ten times as brighen, as a bin suin, and the fainter stars near the Dipper, has the suin, and the fainter stars near the Dipper, because the suince the start of
bright. This system therefore consists of unusually bright. This system therefore consists of the great extent. It is remarkable also for the great extent is assoc Botteen the outer that of the group there must be hundreds of stars, of which over one in clock, which have no connection with it. It is as if a dosen some of the connection with it. It is as if a dosen some system of the connection of the same spect. Though the connection with a same spect. Though the connection with the connection with the connection of the connection with the connection of the connec

in the same direction and at the same speed. Thought many of the crowd intervent, the mare fact of this progress toward the same point seven to distinguish them, and is a mark of their common origin. It may be added in conclusions that a very large proportion of these stars, at least six out of the ten abon on the map, are either visually or specify-scapitally one. Turning now to the constallations, excitating the same proportion of the contraction of the contracti

NOVEL CHANGEABLE PHOTOGRAPHS

BY F. HONORE

"Prof. Lippmann recently described before the heademy of Sciences at Paris some novel changeable sistographs made according to a method devised by f. Batanave, secretary of the Faculty of Sciences of

feeping woman. By inclining the picture a few milli sters and rocking it elightly, the eyes apparently the like the eyes of a porcelain doll, with the exthe the eyes of a porcelain doil, with the experior, however, that the entire face livens up in
the extraordinary manner Incline the picture
that the system strength of the product of

me be used to obtain the effect because to the control of employing a special half tone acrean a creder to explain how M Estanave obtains his creder to explain how different photographs ma uruer to explain now at Examave obtains his gladars, let us consider two different photographe-ths one D representing a electing woman, the other is the same woman awake Each photographic posi-tive is ruled horizontally from top to bottom, so that both photographs appear finely banded if we reboth photographs appear finely banded if we re-move from the positive D even alternate pairs of bands, and from the positive E odd alternate pairs of bands, and if we place upon the positive D the bends taken from E and upon E the bands taken from D, we will obtain two new pictures which we may designate D' and B'. These new pictures D' and B' are composites of D and E. If the bands are narrow enough, 30 per centimeter for example, their

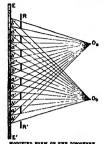

THE SLEEPING WOMAN

discontinuity will not be noticed. The composite uncountry will not be noticed the composite pictures will apparently be complete and comparable with the balf-tone pictures to be found in the Sauk-Tivic American or in any other modern illustrated periodical

Let us now combine the two composites D^1 and R^1 in other words, let us transpose strips of D^1 and

strips of E^* without disturbing their order. We obtain still another positive D^* , formed by the combination of the two preceding positives. When looked

MODIFIED FORM OF THE DISCOVERY.

at directly this new posttive P is rather confusing, hut when looked at through a glass plate ruled alter-nately with horizontal opaque and transparent bands of a width equal to those constituting the positive itself quits a different effect is obtained. If we hold itself quite a different effect to obtained. If we hold this glass screen in such a meaner that the opaque bands cover the bands of the positive h we will see only the bands of the positive h, and we will obtain the portrait of a sleeping woman On the other hand, if the screen be elightly shifted so that the bands of the positive h are covered we will have a portrait of a screen with a wake. Since the different effects of a woman wide awake. Since the different effects are obtained simply by shifting the screen, the single photographic view seen through it can be caused to thange its appearance very rapidly simply by changing like speed of the screen movements

ing his speed or the stream movements.

In actual practice the ruling of the positives and
the transposition of the bands, as well as the use
of a suitable screen, is attended with consider
shie difficulty. For that reason, M. Estnave has
devised a singler method which is illustrated in the

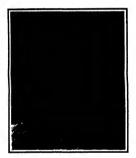

devised a simpler method which is illustrated in the arrompanying diagram.

Let a and b be two different objects the luminous says from which full upon a sensitive plate or a ground glass ES in the path of these rays at a sultable distance, the horisontal ruled acreen RR is placed in the diagram the spaces separating the lines of the screen are considerably exaggerated inter or the screen are community cangerate and the screen itself is shown in vertical sensitive plate will receive a series of images of a alternating with

In making the positive photograph according to this method, the subject is first placed at Oa and then at Ob At Oa the subject must appear asfeep, and at Ob wide awake A composite picture will be obtained on the sensitive plate If this picture be examined through a screen similar to that by means of which the picture was made, and the visual angle be varied either by shifting the eye or shifting the screen fu-portrait will apparently open and close its type

Theoretically several different pictures can thus be Theoretically several different pictures can thus be superimposed in actual practice M Estanavo has combined three which are clearly visible However there is a limit to the number of pictures that can thus be combined for the positives become more and more incomplete as the fillform bands composing them more incomplete as the niferral bands composing them are more and more elongated in the case of two aspects, the elements of an image are adjacent, the one to the other with three aspects, the consecutive elomonts of an image are acparated by two elements belonging respectively to each of the two other images, and so on

images, and so on in order to simplify the adjustment of the screen relatively to the composite image, and in fact to avoid adjustment entirely. Mexicane employs an improved auto-streeneepic plate which ho has in writed. This plate is rused with a screen on the side which is not consulted, the rulings being such that alteration expanse and temporared bands are pro-that alteration expanse and temporared bands are produced The new invention of M Estanave's is so con ceived that the plate serves a double purpo plete is mounted with the ruled surface in front, or plate is mounted with the ruled surface in front, or it can be so planed that the ruled surface is either horisontal or vertical. When the ruled surface is placed horizontally changeable photographs are ob-tained. With the ruling verifically placed images can

THE WARING WOMAN

be obtained directly visible to the eye with a store scopic effect. With two stereoscopic lenses mounted so as to obtain filiform images formed by the super position of the two images of the object taken under position of the two images of the open taken under the same aspect, the verifical lines of the screen se-lect for each eye the particular image of the stereo-scopic couple which are intended for it

At a very early period repeated efforts were made to replace mother-of-pearl, so expensive at times, by some substance possessing the same valuable proper-ties, but the results arrived at siways fell far short some substance possessing the same variantle properties, but the results arrived at large self far short of the espectations which were suterathed, and these demands are supported to the same problem, it being believed that the progress made in chemistry and applied science suffered grounds for hoping for more favorable results and, in fact, some of the initiations of mother-of-pauri now made seem to show that these expectations will not disappointed. It is true that hitherto but few detailed directions for making strikeds mother-of-tended the superior of the superior aluminium silver will never gain a footing as genuine dinies when, for instance, not even the well-in colluints mother-of-pearl can gain recognition

as an equivalent. The purpose to which artificial its efficiency as a substitute, and this degree of effici ency in its turn depends mainly on its external re hisnes to the natural product. For combs, ha s. hat pin heads, etc. celluloid mother-of pearl may be used with heads, etc. celluloid mother-of pearl may be used with-out hesitation as an initiation, for ornaments, on the other hand, such as fastaning plas, bucktes, etc., the preference will unturally be given to substance whose external resemblance to the penulian material is com-pleted or hearty as Special interest, therefore, at-taches to a new method of preparing artificial mother-density of the second of the second of the second of the contraction of the second of-pearl, which we proceed to describe in detail

The ascertained fact that collodion, mixed with car-

The accretained fact that colloides, mixed with can-be halphilds and a few parts of pear-feitive fluid, yielded a substance more or less resembling mother-opeart, led to a method of working directly with celluides solutions, and in this way the celluided a material which has been used for a variety of pur-poses in the industrial arts. As however, the in-imamability of celluided considerably restricted the employment of this new material, efforts were mot-tor replace celluided by another substance. This sub-tance was celluid. to replace celluloid by another substance. This sub-stance was cellife. The process of preparing artificial suction-d-pearl from this base is as follows: 100 parts of childs. Esselved in 38 to 30 parts of glacial accele

acid or chloroform are mixed with 20 parts of cal acid or chloroform are mixed with 20 parts of cal-cided magnesia and 4 to 8 parts of post cessence, with continual ettring. In this way a more or less visid mass is obtained which is allowed to dry in the air. If a few drops of carbon blashphido are added are it a new crops of caroon manipulous are anose to the fliquid solution a beautiful iridescent inster is imparted. As ceillit dissolves comparatively slowly, it is advisable to prepare the solution a day or two beforehand. In case of need, the process of dissolving beforehand in case of need, the process of descoving may be somewhat accelerated by sloc heating in a water-bath When dry the artificial motier-of peari present the appearance of polished mother-of peari plates that in addition it is distinguished by great ductility and shatelity. The treatment of this arti-ficial product is, therefore much assier than that of smulic mother-opear! It has also been attempted to substitute mother-of pearl dust for magnesia and very satisfactory results have been obtained in this very satisfactory results have been obtained in this way it is also possible by means of this proves to produce articles peris casely like real ones to this purpose the artificial product is propered in rather thick plate from which with a re-of and parts of any feeling size and form turned on the lather Those parts are superior in point of resemblance to the natural product to the fish or wax pearls hitherto made from glass and are not so brittle as the latter—Deutsche Goldschmiede Zeitung

NOTES ON OVERHAULING A BO

Square Hunging for Boats.-I think square bungs are a big improvement over round bungs. They do not waken the planking or chafing streaks and may more quickly be inserted

The chaffing strick on a round stern that has been bunged with round bunging invariably breaks sooner or inter where the round bungs have been inserted Where the square bung is used the naif is driven and

SQUARE BURGING

set. The square punch which is a trifle larger than set The square punch which is a trifle larger than the nail head, is then driven in making the aperture for the square buing This punch should be hardened and ground on an onery when making the corner just us keen and sharp as possible. Obbons rectangular bungs are perforable where the boat nail is used in planting set. The hums are quite easily made of/16 of an inch square with a small burs asset, thin the new table slightly to produce the laper on two

sides of the bung
Wheel Calker—The wheel calker illustrated here Wheel Calker—The wheel calker illustrated here-with will esselly fires cotten into solid wood where there is no seam or joint. The shape gives one con siderable leverage. The cotten is first placed along the seam by attaching it with the point of a kinife at short distances, just enough to keep it in line with

WHEEL CALKER.

It is now roady for the knife shape which calks it very rapidly Take a strip of iron %, by % inch thick, 2½ feet long and bend it to a flaring Ushape. The bottom of the U should be 4 inches as ross and to it the wheels are riveted. The iron strip ation it be drawn down a little on the ends to receive the handles. The wheels are 18 liches in tilameter. One of the wheels has a square edge 1/16 of an inch like. The other wheel is 3/16 of an inch like with the edge sharpened like a knife. There is a simpleg same plant of on the framework from a rest the square spired of decired death for receive the post to the desired death for receive the post type. Marking the Water Line on a Boat—Level the boat athwarmship, and decide where you would like your water line, which in the case of a knutch or small motor boat should be from two to three inches out edges 12 or 14 feet long placed lovel athwarming to the boat on a the bow and one at the size at the height of the water line decided upon Stretch a should be drawn down a little on the ends to receive

MARKING THE WATER LINE OF A BOAT.

cord across the simight edges with the weight at each one to keep it taut and let it tust touch the biles of the heat so that you may dot your water line along the heat. The proper way to make a true line is with a thin batting 3 or four inches wide and 10 or 12 feet iong with the upper edge pressed against the boat to correspond with the dots. Be particular to keep the batting exactly plumb edgeways and you can correctly

scratch in your water line.

Simple Method of Weighing a Roat.—Take a lever six or eight feet long, place a fulcrum on the ground

BY ALBERT F. BISHOP

near the bow Let the fulcrum (at 2 in the drawing) be just six inches from the end (1) of the lever that be just six inches from the end (1) of the lever tasks in under the bow of boat. A person that would weigh, say a hundred and fifty pounds, should work along on the lever, say to 3 or until the weight of his body would just lift the bow of the boat fear of the block ing With a piece of chalk make a mark on the tever at this point. Divide the distance from the fulcrum to the chalk mark into 6-inch spaces and add 150 bounds for each space. For instance, sight space

WRIGHTEG A BOAT WITH A LEVER.

would mean 1,100 pounds, which would be a little iese than half the welch of the boat, as the how out data half the welch of the boat, as the how out is manufactured in the same manner. The boat hoting baster at this end will call for more spaces. When this weight has boen determined add the two weights and the result will not be far out for the entire boat. The blockings the beat rest on while the boat is 10000 should be at the extreme and.

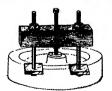

A Home-made Lifting Jack—The jack here illustrated is made with a srew an inch in diameter and eight or more in length and a good heavy and, the corners of which have been notched down with a file to receive a heavy washer. The jack they may the corners of which have been notched down with a file to receive a heavy washer. The jack to the wide to receive a heavy washer. The jack to the part of the nut which comes through the washer should come through far an 1,200 pounds, which would be a little less

A HOME-WADE LIPTING JACK.

ough to allow for good heavy riveting on the was This makes the base for the nut to rest on and it is then placed on a wooden block, which is well secured town piacet on a women most, where is were necessary with four wood server. The base of the jack is a heavy block placed with the grain running at right angles to the upper block which holds the nut. The cap and lever require no description. The brand base prevents the jack from settling in the certh and from capaizing as well, which is a good feature around boat

A Home-made Wheel Puller—A simple wheel puller can be made by taking a piece of maple about 3½ inches square and about sixteen in length and fitting it with the bulls about as shown in the accompanying sketch. The nut for the center screw has the wash

HOME-MADS WHERL PULLER.

attached to it in the same way as in the lifting jack and it is similarly attached to the maple. The wheel bolts carry two bread suck is calcide on the rear face of the wab or spokes of the wheel. The wheel is shown in dotted lines. That series is often recorded to in removing wheels from gaseline engines. This is—plement said the lifting lock have been in use four or five years. They have slood bots of wear spat appraisably are as alreage for ever. A province journally

on the wheel puller is obtained on the outside is with any suitable wrench. with any suitable wrench.

Convenient Flywheel for Gasolene English

all the flywheels for small marine gasolene on are filled up with spokes or webs with few hole them, which makes it very awkward to get at the centric strap and pump to tighten the nuts and , box. Nearly every time this is done the man in BOX. Nearly worth time this to describe the handmer. I have designed a whoel and used a single for four years. It has only two shand wind doing away with the orangle. angine for four years. It has only two and hand rim, doing away with the crashs which is a dangerous feature. The plate lythogo covers the key as well as the styles, tached with two machine screws.

This makes a very tidy looking wheel

intely safe because the

A CONVENIENT PLYWREN.

caught in the spokes. It is a great convenience in the stage behind the wheel or repletation, as it follows take a minute to remove the cores place of the stage

THEPROVED GASOLINE VEHICL.

and should always be smaller than the receiving hele in the gaseline tank. The supports for the tunnel are made out of garbanisade ires I inch wide east 4,78 thick, bending the upper end to conform to the angula 8,745-inch galvanisad wire hosp about tog inches in diameter. A critic larger than the upper part of the tunnel is good proportion. In a standard exists which can readily be procursed. The parts that are attended are well endforced. It is not necessary to river these. Place a virue sums about 6100 or existy means the second of the contract of t

Place a vire gauge about fifty or skry menh to the inch inside of the tunnel. It a champing fifty is de-sired make a band of metal that will easily skip inside of upper part of the tunnel. The lower end of this is covered with champing, which is hald in place with small twine. Task a strip of valuanised fifer to the measuring with measuring stick.

also build several hinds of light-weight sevenantie SCHRIFTIPIO ARROPLANTE CO.

The Design and Construction of Induction Coils A PREDERICK COLLE

Old in Pil baghan and years 100

Table work gives in minute details but yet directions for making eight different de quies, verying from a mail one giving a limit spark in a large use giving a limit spark. The dispensions of eight and every form to the smallest group are given, and its exception are written in its imagine one only one exception.

IN. was the first of th substances separated from pit residues by Mma. Ourie. Vario ive than transum. Marcawaid isoparated from 15 tons of pitchbb about 3 milligrammes of intensely ive material which he called radii lurium, since it was separated injurium, with tellurium as an impurity. By

in the material which he called radio-talmaterial which he called radio-talmaterial which he called radio-talmaterial which he called radio-talmaterial which he called radio-taltalmaterial which materials as a coper plate into a solution of the
stratement of the stratement of the second radio of the stratement of the strat

grows potentiam and has a period of half transformation of about twenty years. Since potential to a state of the state of

filmes polonium emits e particles, if its products of decomposition, as hit the other e-ray products, should helium. The production of helium m a preparation of polonium has been erved by Rutherford and Boltwood seem a preparation or potentiam has observed by Rutherford and Boltwood-descreed by Rutherford and Boltwood-maker Seth., 1609, and also by Mina. Ourse and Dobleran in their present ac-partments. Boltwood several years ag-suggested that the end product of the residum series was lead, and has collected strong ortinone in support of this view by comparing the amount of helium and lead in old radicactive minerals. Since polemium is the last of the active prod-arks observed in the radium series, it is to be expected that polentiam should be active producing producing one atom of helium and one atom of lead. This point of view receives additional weight of belium and one stom of lock. This probe of view receives additional weight from consideration of the atomic weight from consideration of the atomic weight to be expected for the end product of value. Since in the uranium radium series, serve a particles, each of which is an atom of helium of atomic weight fors, are successively expelled before radium F is reached, the atomic weight of policular and the product of the server of th of 210 5, and after the loss of an a parti-cle, a final product of atomic weight 206 5 -a value very close to the atomic weight

It is a matter of very great interest and importance to settle definitely whether polenium changes into lead. The whether polonium changes into lead. The syidence as a whole has long been in favor of that supposition. The outlook is very promains that the experiments of Mine. Conte and Debierne will settle this question conclusively. No doubt an interval must elapse to allow the polonium to decay before the flasi examinations of the residual substance can be

The Revolving Safe.

The revolving safe is the latest advance The recovery and the statement of the each industry in its continuous coatest with the bursier, who, in the most recovery continuous coatest with the bursier, which, by means the coatest recovery coatest recove its vertical axis, without coming in con-tact with the walls. In the inclosing masonry and in the strong box, doors are contrived, by means of which the strong box is accessible from outside, as long as it is not revolving, which would be the case for instance during the beatness hours of the bank in whose quarters the hours of the bank in whose quarters the revolving safe is set up. At the close of business, b.th doors are closed, an elec-tromotor, operated by a storage battery, is switched on and the strong box then is switched on and the strong row tuess revolves at a uniform rate of speed uninterruptedly until a predetermined period, to which a clockwork connected with the switching apparatus is set, when the moving mechanism is automatically switched off.

time movering mechanism is automanosity writished off.

While in revolution, the strong box is absolutely unasanthable. The electric motor and the storage battery are placed inside of the steal chamber, among there has been a substantial and a state of the revolution matter and a state of the revolution of the state of the revolution in the state of the revolutions, is announced at the state of the revolutions, in the state of the revolutions and the respective state of the revolutions, and the state of the revolutions It is not the revolutions of the rev

Fireproof Windows For Your Factory

American Jomes and Gardens covers as some it tests with loss building from the dulty and competed as the modes home on and lost, to the building of manions and seekers. All degrees of gardening from laying out of landscape to the platting of a window-bux are deal with. Practical questions of water sopply, of smitistion, or the arrangement of the hitcher receive equal treatment, with draping of window-or the arrangement of delchias.

reasonst, with curping or windows or the arrangement of old china.

PENNSYLVANIA RAILRO

Bulletin,

DREADNAUGHT CARS.

The nub of railroading is first-class equipment and reliable service. The Pennsylvania Railroad provides this for the public. For many months big all-steel coaches, built like Dreadnaughts, have been operated on all through trains. Their casy-riding qualities and steadiness of motion have been widely praised. The all-steel dining cars too have distinct advantages over the wooden ones. They are stronger and steadier, and the act of eating is made more enjoyable by the smoother movement.

There are also some steel Pullman Cars-Combined Parlor-Smokers and Baggage-in the service now. Travelers like them. They have plenty of elbow room and they glide over the rails. The Sleeping Cars are coming Some four hundred parlor and sleeping cars will be in use by Summer.

The steel coaches and cars are the strongest vehicles ever built for passenger transportation. They are fire proof, break proof and bend proof. They represent the climax of safety and the perfection of comfort in railroad travel.

The Pennsylvania Railroad has always been the leader in all manner of improved equipment as well as in all methods of making their patrons more comfortable. This is why it is known and honored as The Standard Railroad of America.

The Action of Radium Res.

Upon the Elements of the
Carbon Group.

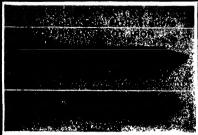

A lively sensation was created, two
sars ago, by the publication of Sir Wilyears ago, by the publication of Bir Wil-ilam Ramsay s experiments on the action of radium emanation upon copper According to Ramsay, the energy released by the emanation causes a disintegration of the atom of copper, and converts that metal into elements of smaller atomic weight, which are included in the copper group, in Mandeléed's classification. group, in Mendeleers classification. Remmay claimed to have found, among the products of the action of the emana-tion upon copper, minute quantities of potamium, sodium and lithium Madame potamium, sodium and lithium Madame Curle repeated Ramsay's experiments, but falled to obtain the same results, and pointed out certain possible causes of error in the method employed by the English physicist. Ramsay has since re-peated the experiments, taking care to peated the experiments, taking care to: climinate these possible sources of error, and has reached the anne results and conclusions as before. He has lately ex-tended bla researches to certain element of the carbon group (allion, itianium sircontum, thallium and lead), which, if the happolhesis correct, should be dis-aggregated by the netlem of the emana-ration and essentially into carbon.

group, and especially into carbon
The following method was employed
by Ramsay and his collaborator Usher From a solution of radium bromide con taining 211 milligrams (about 3 grains) of the metal radium the emanation pro-duced in the course of one week, together with the explosive mixture of hydrogen with the explosive mixture of hydrogen and averen which always accompanies it, was extracted by a pump The total quantity of gas thus obtained amounted to about 25 cubic centimeters, and con tained 0 0912 cubic centimeter of radium emanation, mixed with hydrogen, oxygen carbon diotide and other gases The hydrogen and oxygen were combined as replacion. Texture to the continued are replaced to the continued as a continued of the This was collected in a small glass tube conted with fused caustic potant, which absorbed the carbon dioxide in the course of an hour. The residual gase was then introduced into a giase finely continued to the continued of the continued as a contraction of the continued of the continued as a continued to the continued of the continued of the continued to the continued of the continued of the continued to the continued of the continued of the continued to the continued of the continued of the continued to the continued of the continued of the continued to the continued of the continued to the continued to the continued of the continued to the continu the solution which was to be subjected to the action of the emanation. The con-tents of the flask were left undisturbed for four weeks at the end of which period the activity of radium emanation completely exhausted. The gas was sen drawn off and analyzed. It was found to contain carbon dioxide

It was found to contain carbon dioxide invariably and carbon monoxide in some cases. The following table shows the quantities of carbon thus produced from various solutions by one cubic millimeter of radium emanation

Bolation of
Hydrogen silicon fluoride H₂SiF₄ 0 518
Titanium suiphate Ti(8O₁)₄ 0 982
Zirconium nitrate Zr(NO₁)₄ Thallalum nitrate Th(NO₁), Lond oblorate Pb(ClO₂), 0 102

Ramesy and Usher conclude that carbon is produced, in greater or smaller quantity, from all the other elements of quantity, from all the other elements of the carbon group by the action of radium emanation. The elements of high atomic weight, with the acception of lead, which seems to be particularly stable, appear to be disaggregated more easily than the elements of low atomic weight. Experi-ments on elements of other groups are in progress, but those described above ap-pear to prove seprond question that the atoms of the chamist can be broken up by the action of radium examption. by the action of radium Revue des Sciencis!

American Ingot Iron or Steel Which?

STEEL is said to be the basis of our modern civilization. The corrosion test shown in this cut tells how insecure a basis it is. How much more secure life would be if what is now made from steel could be made from American Ingot Iron. How to make this new metal is a discovery of as much importance as the discovery of Bessemer Steel. American Ingot Iron is practically non-corrosive. Any thing made from it ought to last a lifetime. See that what you buy made of iron or steel is made of American Ingot Iron.

LIEUT ERACKLETON

LIEUT SEACELLETON
OWEVER thrilling the average man may find
Liut Shackletons modest and self-effacing
recital of the Antaretic hardships and tri uphs of his brilliant expedition it is to the scientist that the English explorers character must assuredly appeal most strongly No doubt the dare devil courage of the Englishman, whose love of adven ture has sarried him into the heart of Africa, the wilds of Australia, and the mysteries of Thibet enters largely late Shackletons nature. How else could be have endowed the numbing cold and the paness of put vation? But the sacrifices made during that famous expedition which brought him within actual sight of the Soulk Pole are essentially scientific in characterwhich brought him within actual sight of comparable with the horoism of the man who exposes bimself in the stings of diseasu-carrying insects, that mankind may know how best to protect itself against the ravages of yellow fover and the shoping alchness His modesty of demennor and speech his generous praise of those who accompanded him, his liberality in donating unineralogical and ornitiological collections our muscums collections made when the desire was strong to shandon them in the hour of weakness and hunger) and above all that unwillinguess of his to appear as rival to Capt Scott his former chief, which has jed him to postpone his own Antaretic plans so that Stott may have no difficulty in obtaining funds. are all characteristic of the unscillab selection in whom the sense of personal importance is overwhelmed by the high ideals of the cause in whose furthcrance he is

Scientific too in its purpose is the expedition that Shackiton has postponed in deference to Stott, for that expedition will be undertaken not primarily to reach the Pole but to fathom the many mysteries of the unknown land fronting on the South Indian Ocean, the unknown land fronting on the Solita Indian Ocean, and presenting many scientific and geographic problems for solution By swatematically exploring the coast around King William Land a coast which has never been carefully studied from shipboard because of float ing ice ice will probably determine once and for all whether there is any reason for questioning the claims under h) Adaltral Wilkes to the first discovery of the Antartic Continent Shackleton a sure of fair play. The sense of whenlife justice in other words, end nently fits him for this peculiarly deltate task. The insert reception which Shackleton has accorded Parry for the discovery of the North Pole com

corded trary for the discovery of the North Pole com-ling as it does from a man who knows something of the rigors of polar exploration ought to shame the Con-gress which refused national honor to Peary without proof of the North Poles discovery. The doubt which proof of the North Poles discovery. The doubt which has been foolishly cast on Pargy exploit by a congression whose "furthest north" as one Washington correspondent phrased it is the semi-tropical cold of Omaha. Nob. is more than extinguished by the cordial deformer with Sinch-Polon linas shown toward Pars, on the occasion of their many public meetings.

A PLEA FOR CO-OPERATION,

IT silk development of rapid transit in New York (the has reas led a critical sizes, for upon the events of the next few months will depend to the upon the develop whether a certain proportion of future mishway travel is to be paid for at the present rate of five container they not double that amount Now, it is generally agreed that one of the indispensable conditions of the future development of the pensable conditions of the fullire development of the subway system in this city is that the fare shall at no time exceed five cents, for which sum a passenger must be at liberty to travel from any one part of the system to any other. The universal tendency to-day is toward the cheapening of transportation, and the

possibility of an increase from five cents to ten cents per trip is not to be considered for a moment,

Nevertheless, the people of this city are to-day com-onted with the possibility, if not the probability, of remned with the possibility, if not the probability, of just such an increase of fare, and this condition is due in large measure to the strained relations between the Public Service Commission, whose duty it is to the Public Service Commission, whose duty it is to safeguard the fransportation interests of the public, and the Interborough Company which has a practical monopoly of local fransportation. The Public Service Commission with shortly call for bila for the construction of an additional subway extending from the Bronz to the Battery, which will be absolutely independent of In the lattory, which will be absolutely independent of the route which is now in operation. The new line as laid out would be an excellent one, were it not for the grave direct that nowhere does it make connection with the cristing subway. This defect however, must be made good by providing for each connections as will enable a passenger to travel for one fare from any point on the one to any point on the orter system.

any point on the one to any point on the other system if we look at a map of the present sulway ronte, it is evident at a glance that an extension of the existing lines north from Porty secund Street through Lexing-ion Avenue to the Bronx and an extension of the Broadway line from Times Square down Seventh Avee to the Battery, would provide the city with independent north and south routes. The Public Service Commission long ago recognized that this was the next logical addition to make to the present facilities. and they hoped that the interborough Company would make a proposal for future extensions of their system make a proposal for future excansions or inter systems over these routes. Unfortunately, the company, in effecting to build these lines, has obstituately saddled its proposal with a demand that it be allowed to build a third track on one of the elevated rallways of

Now the city, as the Interborough Compa well knows has established for all time the principle next nows has established for all time the principle list, since the existing elevated structures are a de facement of the streets in which they stand not only shall no further extensions be made but as soon as other facilities are provided, the existing structures shall be removed. Therefore, the Public Service (complusages at one and commission at once and very properly refused to ac-tede to the interborough proposal, and, estensibly, it is upon this question of extending the elevated service the Commission and the company are at variance that the Commission and the company are at variance Falling lo get any satisfactory proposal from the interborough Company, the Commission bave tail out an independent route which extends from Woodlawn and Pelham Bay Park in the Bronx to the Hariem and Pelham Bay Park in the Bronz to the Harriem River, and down Lexington Accuse and Broadway to the Hattery Bids will shortly be asked and as we have noted above unless the interborough should put in a bid agreeable to the conditions laid down by the Commission, the new line will be huilt independently of the existing andway Thereafter, if anyone should Commission, the new line will be built independently of the existing aulway. Thereafter, if anyone should have occasion to make a trip involving a trausfer from one system to the other he will be able to do so only by the payment of an additional fare—a condition which for a large proportion of the traveling public would amount to a nositive hardship

Now the contingency of having to pay a double fare is so serious that it demands immediate and careful as so serious that it demands immediate and treat-consideration We believe that the exercise of a more illustal policy by the Interborough Company and the exhibition by the Public Service Commission of a fit lie more confidence in the attitude and purposes of the Interborough people would result in a compromise of lasting bettefit both to the corporation and the travel ing public. The interporough Company certainly owen ing public. The interborough Company certainty owes mush to the city, and we say this with full remem-brance of the fact that Mr Belmont, at a time when capital was looking askance upon the subway proposi-tion, came forward courageously and provided the tion, came forward courageously and provided the commons capital necessary for construction like has reviewd in the past and always will receive credit for the good service which he rendered to the city in a very critical emergency. But having admitted this much, we cannot lose sight of the fact that avenue has a proved first, that the ambuny property is soon-mously predishelm and second that the turns govern-mously predishelm and second that the turns governing the relationship between the operating company and the city are very liberal indeed if Mr Belmont conferred a great benefit upon the city, the city has repaid him tenfold by providing the subway line with traffic far greater than was anticipated when the

Now the Interborough, with its magnificently equipped system, its thoroughly trained personnel, its strong financial standing and its rich accumulation of operating experience, is obviously the interest best with and operate the new line, making it. equipped to build and operate the new line, making it equipped to build and operate the new like, making it an interral part of the present system. Provided it will give reasonable guarantees, the city would just as soon, and perhaps rather have the Interborough people build and operata the new aystem than any obser custed interest Unfortunatily, the attitude of the company toward the city in the past, as shown in its aimnost contemptuous treatment of the Public Service Commission, has had the Inavitable selbed of years of dutters, it found to hostility, against the property of the past of the property of the company on the part of the public. This tunate, unnecessary, and, to those of us what stand what a really magnificant service. February is at the company is at ing, it is to a certain extent unjust.

Arms on

The present inacture affords a great opportunity to the Interborough Company If it will only waite its never-to-be-granted demand for further elevated restnever-be-erraited demand for Inches elevated with vary facilities, the city will meet the company far a liberal spirit. Should the company put in a Mad for he were like the selection of the present coagestion on their own lines, they will more at once the problem of the present coagestion on their own lines, they will more at one the problem of the extent of their aiready encouncy profitables 5602 of operations, and they will place themselves cross one as last of animals resistantially with the second of the present coagestion of their coarse of the present coagestion with the control of their aiready encouncy profitables 5602 of operations, and they will place themselves the coarse of the present the prese

A REPORM IN METEOROLOGICAL SHIPS.

N common with the other sciences, metaorolog burdened with a dual system of units. G Britain and America continue, in a majority of their mateorological publications, to record rain fall and atmospheric pressure in inches, wind velocity In miles per bour, and temperature in Fahrenbeit de grees, while all the other nations have long since grees, while all the other nations have long sizes adopted millimeters, meters per second, and Omit-grade degrees for the same respective measurements. There have of course been many projects of reform, but only very lately has uniformity actualty been attained in any branch of the science
The United States Weather Bureau and the British Motorwolgist office have admitted years of the most of the science.

Motorological Office have definitely adopted the metric system and the degrees of the Centigrade temperature scale for recording the results of the observations made with kites and bailoons—the former at its research observatory at Mount Weather, Va., and the latter at several "aerological" stations now in operation in the British iales

The British have gone a step further The text tures met with in the upper air are very frequ tures met with in the upper air are very frequently below the freeing point, so that the shallated observa-tions expressed in the Centigrade scale, abound in megality values, which are awkward to deal with and also a fruitful source of errors in computation. The absolute scale, counting in Centigrade degrees from the absolute scare (-271 dog C) has no negative values, and the use of this scale is now common in the values, and he use or this scale is now common in Lies discussion of many physical problems with which upperair research is closely concerned. For these reasons the Meteorological Office has begun using the absolute scale (also called the Kelvin scale) instead of the ordinary Centigrade scale in all records of tem perature obtained by means of kites and balloons. no less radical reform has been introduced in the pub ilcation of barometric pressure, in the same class of British observations The unit adopted is a C G S. unit of force, viz., the megadyne per square contimeter, in place of the familiar units-inches or millimeters in piace of the familiar inits—inches of millimeters— expressing the height of the mercurial column. As a matter of fact, the "mercurial column" is a pure flo-tion, so far as the observations in the upper air are concerned, the barometers attached to tha kites and concerned, the barometers attached to the kites and balloons always being ameroids, and it is much less important to know the height of this imaginary col-umn at any level than to know the fraction of the at-mosphere that lies above or below the level. This fraction is directly indicated when the C G S unit is employed, since 1 megadyne per square centimeter is practically equivalent to a barometer reading of 750 practically equivalent to a barometer reading of 750 millimeters, in latitude 45 deg., which is the average pressure of the air at 106 meters above sea level in the same isilitude. Hence, if we assume 106 meters above sea level as the plane of reference in barometry tand there are sound reasons for preferring it to sea level, the plane heretofore in use), the C G S unit may be considered a "C G S atmosphere," and the may be considered a "C G B atmosphere," and the fraction of a megatyne per square restituenter recorded at any latitude gives, for all practical purposes, the fraction of the atmosphere that live above the point of observation. This until has been named the ser-and its use in all meteorological observations has been recommended by several writers during the past year. Lastly, the Meteorological Glock is now, in its litte and helloon work recording the direction of the wind

in degrees of a circle, counting from true north. East is 90 deg., south 180 deg. west 270 deg., and north 260

It is proposed to establish a wireless telegra-tion at the meteorological observatory on Mount tion at the meteorological observatory on Mount Mira-dor in the Philippines, to give warning of typhoons to vessels in the China Sea and points along the China coast. A similar station will probably be established later at Santo Dominge de Basco on the Island of Batan, for communicating information of the pres-ance of typhocos in that vicinity to the besiquarbers of the Philippine Westher Eureau et Mantin.

Mr. Henry Wilde, FRS of Aldericy Edge, is providing Oxford University with funds for the institu-tion of an annual lecture as a memorial of Halley

A monument to Horace Wells was unveiled on March 7th in the Place des Eints Unis Paris Wells was born in Hartford Conn. In 1815 and was a pioneer in the use of ultrous oxide gas in dental operations. He committed suicide in New York in 1848

We have read somewhere that Peter the Great, when he was staying in England, had a particular liking for the companionship of Hailey, and that after canning with him at Deptford one evening he wheeled islin in a barrow through a yew hedge and did such damage that its had to pay handsome compensation to John Evelyn the owner which incident shows that Shakes care was right in thinking that not every astr plucks his judgments from the stars

pucks in judgments from the stars Gold is usually classed among the metals which are soluble only in squa regia, i e a mixture of nitric and hydrochloric acids it has been observed however, that hydrochloric acid atome is able to dissolve old, in the presence of certain organic compounds which are here arranged in order of activity alcohol, amyl sicohol chloroform ethyl sicohol, chloral hydrate, phenol (carbolic acid) cane augar giverine triozymethylene, formaldehyde The solution takes trioxymethylene, formaldehyde The solution takes place slowly in the cold, but is accelerated by heating

The Meteorological Office at London and the Deutsche Seewarte at Hamburg enried on jointly in February March, and April of last year and again in August and Sentember, an elaborate investigation with regard to the use of whices weather reports from vessels is weather foremating. The co-operation of the princi pai Brilish and German transatianik steamahip lines was secured, and each of their steamers sent reports was accurred, and an order steamers seat reports to kee daily while they were within a prescribed some of the occan. The net result of these experiments was that a majority of the reports arrived ton into to be of any service to the forecaster. It appears untikely was that a importly of the forecaster. It appears unitled that the meteorological institutes will feel on ourse that the meteorological institutes will feel en oursigned to take any further steps in this direction until the delay in transmitting messages from ships to shore stations is much reduced. The Secwario has announced that of the messages received promptly enough to be utilized by the forecaster during Angust and September, none led to any medification of the forecast as based up reports from land stations, but it is admitted that this might not have been the case with a differ-disposition of the weather conditions over the ocean

The Austrian State sale of radium has been en trusted to the Bergwerks-produktenverschiless Direk Minister for Public Works The radium is said in the form of radium barium chloride of three diff grades the price for each milligramme of radium chloride, including the containing cell, being 400 kronon it is packed in cylindrical cells of 21 milli stoned it is parked in symmetrical colls or 21 mills meters dismiter and 9 millimeters long, formed of nickel plated brans. On the bottom of the cell a layer of lead is case, in which is a square depression for the reception of the radium burlum chloride. The cell is closed by a mica plate held in position by the screwed on upper part of the ensing. On the bottom of the casing is an official stome (an eagle) and the series numing is no olikial stamp (no eagle) and the series num-ber findium cells senied with kad and stamped on the soldered part, are also supplied. The cells are packed in cotton and sheet it ad in a small box, together with a certifical bearing the number of the cell and the weight and radium-content of the prepara The boxes are scaled with strips bearing the numbers of the cells, and are despatched by por registered packets at the cost and risk of mir have

Howard of Inchty different systems of storm signals are at present used by the maritime countries of the world. A uniform international code is a deratom, and the task of devising one use intrusted by the international Meteorological Committee to a small commission which met in Loudon last ammuer and agreed to recommend to the committee the adopand agreed to recommend to the committee the adop-tion of a code proposed by fraf Morre chief of the United States Westler Bureau. This code substi-tutes a few simple combinations of the large conical symbols now used at a majority of the Europeau parts symmon now never at an angury or me annoyan pro-for the storm flags herefore used in the United States and some other consistes. Combinations of red and white funterns are to be used at night to convey the same information as the day signals. The proposed code has not yet however been formally adopted by any government, peuding the decision of adopted by any government, pending the dec meets in Berlin next September Since the London meeting objections have been raised by the German anthorities to the proposed night signals on the ground that they are not sufficiently distinctive and might be confused with other harbor lights. The Deutsche Seewarts at Hamburg is now experimenting with several systems of night signals and will lay the results of its investigations before the committee

TIMING AN AUTOMOBILE RA

AN AUTOMATIC INSTRUMENT THAT TAKES THE PLACE OF A STOPWATCH

Even the casual reader has no doubt observed that automobile records are now expressed in hundredths of a second, whoreas but a few months ago it was impossible to obtain any greater precision than fifths of a second, sit of which indicates that the use of the

time honored spill-second stop-watch been outgrown in automobile races one stops to think about it it is really absurd to try to time an automob ing anywhere from a mile to two miles and over per minute with an indicator that crawls at a smil's pace around a dial but an inch and a quarter in diameter. In the recent race at Ormond, for Instance where the mile record was reduced to 27.33 seconds by liarney Oldfield he was traveling nearly 200 feet each second, which is equiva-iont to the length of an ordinary New York city block When automobiles were first used for racing purposes, they were timed by hand with stop watches. But, wherever nte operator is depended upon to snap a stop watch, inaccuracies are apt to cre

in due to the fact that one person is quicker of perception than another. The timer must see the start of the received and as soon as this impression is received must start his watch, then at the close of the race the same operation must be undergone to also the watch. The little required for this mental and physical operation varies in different persons, and is known as the personal element. Not only does it vary with different persons but with the same person at differ entiles and interest persons but win the same person at duser entillines depending upon his mental and physical condition. For this reason, even in the timing of foot races it was long agn found necessary to have three timers and to take the time of the middle watch, for the instruments of the three timers varied as much as investifith of a second Early in the history of automobile racing an effort

de to climinate the personal element by hav ing stop watches snapped automatically by the cars thenselves making or breaking an electrical contact when they crossed the starting and finishing tapos itut, as we have just pointed out, even with the por sonal element climinated, stop-watches are entirely too slow to record the time of so rapidly moving an object as a racing automobile. The experiment of using a chronograph was tried in several of the races last year but as this did not prove very satisfactory, Mr C H Warner of the Warner Instrument Com Mr C H Warner of the warner instrument com-pany determined to make a special instrument par-licularly adapted for this purpose. This instrument van first used at Atlanta last December, and has just been employed for timing the Ormond and Daytona reces I works with the utmost precision, is en-tirely automatic, and makes a printed record of the race, reading to hundredths of a second. The neces-sity of such great reducement of timing will be appre-ciated when one considers that the "Lightning Bens" during its record mile run was traveling at the rate of 2118 inches at every bundredth of a second

Warner's instrument consists of four type wicels, one of which indicates boars the next min ntes the third seconds, and the last on of a second. The wheels are operated after the man-ner of an odometer instrument.

Over the wheels runs a strp of pa par and above that a typewriter ribbon, and a record is made by a hammer actuated by an electro-magnet, which strikes the ribbon and paper against the type wheels. In the circuit of the magnet which operates the hammer is a relay switch controlled by an electro-magnet in a circuit that is normally closed This closed circuit is connected with the starting and finish inpre, or with inpres at other points where if is desirable to record the The tape consists of a wire sirciched across the course at a height of a few inches above the ground and this wire is connected, to a switch ingeniously constructed to be opened by the shock, rather

than an increase of tension when the wire is struck by the wheels of an automobile. When the switch opens the instrument prints a record The type wheels are frictionally ment prints a record The type wheels are frictionally mounted on a driving shaft, which is rotated by an electric motor. At the start of the race they are held stationary, and are not released until the starting wire is depressed, when they wint zero and thay begin their revolutions. The hundredths wheel makes a revolution every two seconds. Obviously, the most important part of the instru-ment is the regulation of the electric motor which drives the type wheels it is impossible to construct a motor so perfect or a storage battery that will dis-charge so uniformly, that there will be not the elight

An instrument that times recen to handredthe of a see

To Homodel the House of Representa

Because the acoustics of the House of Rapressitatives, the second of the House of Rapressitatives are so had that it is aiment impossible for the Speaker to hear a member of the House, unless that member has lungs of leather, plans have been drawn and all preparations made for a transformation of the lower house of Communication. e of Congress.

lower house of Congress.

For many years now there has been trouble in the House both in the way of acoustics and with ventilation. For such a large body, these two principal features have not been as they should be. The plans in contemplation will remedy these defects, and make the

One of the main ideas to be put into executi the reducing in also of the chamber in this way it is thought that with smaller quarters, doing away with some of the galleries, and by narrowing the chamber, the accounties will be all that could be desired. The ventilation will also be arranged to better

mplated also bring the Ho The plans as contemplated also oring the House or Representatives in the same fashion as the British House of Commons. In this manner benches and small shelves will take the place of the desks and easy chairs now used by the members. The benches will resemble in appearance the chairs used in the-

aters. By taking away the deska and easy chairs, it is thought that those members not interested in the debates or speeches will absent themselves from the cham

themselves from the chamber
The Scor of the present chamber has an area of nearly 8,000
square feet. The Scor plan of the
proposed hall will only be shout
8,000 square feet. The scating capacity of the new hall will be 430, pacity of the new hall will be 430, although there are now less than 400 members of the House. Bosse of the lobbles and extra

Bons of the lobbies and extra-rooms will be cut out, and the ro-duction in size of the hall will, of course, result in the reduction of the public galleries, whose seating

d allo run.

Owing to the possible conditions of the hall, with regard to the hall, with regard to the constants and ventilation, many members while away their time by convening with each other in host touce or add to the constains by siamming their death or thicking the emploides, his portnenia are being made now for a noiseasing required or with the control of the constant on the thicked around.

Occaprate has airrady appropriated over half a juffice to didner for the trappolycomities, and the westlenes or withing for the obligations of the Santon constants.

A FINE LONG-SPAN MASONRY ARCH BRIDGE

BY OUR ENGLISH CORRESPONDENT

There has been erected on the new Bellegards-Chistery shootric rathway in France a masonery bridge which in span and height rathe as the largest of its type in the country, and which possesses many interesting features. The bridge is attented in the De partment de l'Alta, and is in close prox.

imity to the frontier of Switzerland in the canton of Geneva This imposing structure was designed and erected un der the supervision of Monsieur Picard der the supervision of Monsieur Picard engineer in chief of the Bridge De partment to whose courtesy we are in debted for the accompanying illustra-tions and details, and Monsieur Dor-road surveyor in chief of the depart

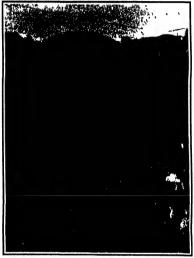

The new railroad passes through the wildest and most picturesque spots of the Jura Mountains and in its location the Jura Mountains and in its location follows the course of the Vaiserine stream a tributary to the Rhône This rivulet is crossed twice first by means of the Bellegards viaduct comprising seven spans each of 60 feet in the close seven spans each of 60 feet in the clear by 150 feet in height, and secondly by a haudsome masonry bridge the Monlin des Pierres or Montangas which has a main span of 262 feet 81/4

At the latter crossing the river flows through a does prok zorse, the preriptious banks of whith are over 170 feet in height. The rock was found to be of such excellent bearing quality that the engineer in chief decided to the foundation of the control of the At the latter crossing the river fic provide width for two foot pavements a railroad track of meter gage and a roadway paralleling the railroad track

mount the great span on either sldc have semicircular openings of 17 feet 4½ inches clear They are carried on piers having a thickness at the top of 8 feet 6½ inches and the sldcs parallel with the axis of the stream have a batter of 1 in 10 from the point at which they rise from the

Owing to the depth of the rovine the erection of sive framework As the keystone of the main span is approximately 217 feet above the level of the water it approximately 217 seet above the savas of her water is was necessary to erect wooden falsework from the stream to the level of the abutments to carry the cen tering and this temporary work comprises three sub stantial towers built of wood and strongly braced

together. The towers were each some 113 feet in beight and were erected on masonry piers 13 feet in height built on piles driven in the bed of the wiream In creating the towers it was imperative that am ple provision should be made for wind pressure as

Timber falsework ready for the laving of the mesonty

the storms which drive through this raving an often of extreme severity. This was accomplished by tying the towers to each other and to the embankme and the pier bases by steel cables so arranged as to provide a system of braxing which served to hold the whole of the fatsowork perfectly rigid. The little character of the timber contenting is plainly visible in the accompanying litustrations and it may be mentioned that in this part of the work 21 1881 cubic In placing the masonry in position care had to b observed to guard against any sinking of the timber ing under the superimposed weight, and in order to

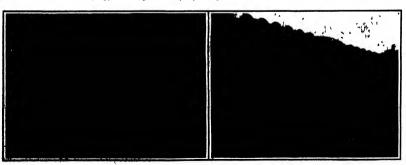

lessen the extent of any deformation from this cau leases the extent of any deformation from this cause the engineers caused this stonework to be laid in right sections independent of one another which were finally connected together. An actial cableway was exected across the gorge by means of which the Limber plons or intering and arch were

cricted the whole of the material is ting conveyed to its site and set in pon by this means

The bridge was commenced in Aus the bridge was commerced in Aug ust 1908. By January 17th of the fol-lowing year the whole of the timber falsework had be noted up and the erse-tion of the musoury was completed by Angust list last When the masonry work was finished the timbering was dismuntied the resonal of the centering was accomplished by emptying the boxes filled with sand on which the boxes filed with sand on which the various parts of the falsework frame risted which dropped the whole of the timbs ling sufficiently to cushic it to be handled. The falsework was demol-lahed without any movement being notied in the masonry by November 7th When completed the bridge will exiel in span any similar work ling in France while its height ever the valley which is equal to that of the tweers of Notro Dane in Paris is greater than that of any other i r single span masonry irrigit elsewhere it the world its jotal cost will approxi-

According to the Firstile Railway Journal exteriments with a method of increasing traction by magnetic wheels have been conducted for some time by Mr. U. Helmy of Lowell Mass. The wheel comains four magneticities out side of which an four segments compiring part of the water and a ling of 1 per cent manganess steel is damp d between them and the which impure to sand the mangate it cuit into the lail. OUR MARYELOUS AUTOMOBILE INDUSTRY

If ever an industry has grown by leaps and bounds, arely it is that of making motor cars. Even the bleycle In its unimiest days did not produce machintotal value for ten years could equal the truly enor mous sum of money represented by the automobile products made in the United States between 1895 and Mere figures tell but little For that res se have presented on the front make of this is graphic illustration, in which the wonderful strides made in the manufacture of motor cars are tellingly when it is considered that the Industry had to weather the severe financial depression of 1908, a period which was one of the most critical in the recent fi history of this country

idered merely from the standpoint of monay the automobile industry in this country presents a most wonderful spectacle. The total estimated value of automobiles to be manufactured in 1910 is \$237, 699 699 When the industry was born in this country, which was in 1895, the estimated value of the machines turned out was only \$157,000. In the brief space of turned out was only \$10,000. In the brief space of twelve years literfore, we have created an industry whose annual product is valued at millions. The later mediate stages between 1895 and 1910 show a growth which is stup udons. The stage from 1895 to 1899 marked an increase in the total value of nearly a milmarked an increase in the total value of mearly a mill lion dollars, the actual value of sutemobiles manufac-tured in 1899 being \$1,280,000 Still more remarkable is the development from 1899 to 1802, for the value ting of the automobiles product in this country increased tearly sixteen fold in that time, the actual value of an fomobiles produced in 1903 being \$16,000,000 Remark able as that increase undoubtedly was it was almost d by the interval from 1903 to 1907, for in 1907 \$105.000 000 worth of automobile mar bipery was many sion, owe one worth of automobile manufactured From the year 1807 to 1910 s 100 por cent increase is to be expected in other words, in these three years the More increase in value of the automo-bile industry will be greater than the total value of

bile industry will be greater than the total value of the industry in the year 1907. An industry which has grown with such startling appoints and which is valued at so princely a sum, naturally gives employment to an army of mechanics, and of them whitele men handsomely paid. Thus all of them whitele men handsomely paid thus we find that the mere wages paid for mechanics in 1910 will amount to about \$1100.000.000. The chamferers who drive the many cars which were in use in 1910 carn \$25,000 000 at the very least in 1910

The number of automobiles produced is nothing short of staggering. If all the cars of 1910 were placed and to and, they would reach from New York to Pittsead to and, they would reach from New York to Puta-burg, a distance of 438 fe miles This output of 200,000 is three times greater than that of 1997, considered from this linear standpoint, for the automobiles of 1997, had they been ulsaced end to end, would have extended from New York to Harrisburg, a distance of 19186 miles Compared with this, the 13-33 195 miles Compared with this, the 18,333 automobiles mannfactured in 1002 access executingly small, although as a matter of fact the machines for that year, had they been placed end to end, would have extended from New York to New Branswick, N. J., a distance of 29 26 miles. When this, small as it seems in comparison with the gignatic production of 1810, is huge when we consider that between 1805 and 1890 its 670 automobiles produced in this control was the second for the control of 1610, in the work of the work of 1650 to 1650 t tance of 1 46 miles.

17sd all the automobiles made in 1910 been converted into a single luge machine, the result would be, as our front page illustration shows, a rar which would be longer him in attending 181. Paul," measuring a 161 feet from air on teater P year the output of 1899 bad it been thus converted into a single machine, machine of 1802 similarly considered would have been three-quarters as long. The output of 1895-1890 is of vourse, vanishingly small in comparison with this ginantic trans-triantic steamer. Naturally an industry of souch Thanks proportions must be capitalised at militons. On the whole, it is made to expitation of the proportion of the proportio a single luge machine, the result would

mobile manufacturers is about \$250,000,000. The out-put for 1910 alone will surely exceed 200,000 cars. Even now there are over 180,000 automobiles in use throughout the country The actual number of employes in the industry is 125,000 in motor-car factories, with amoyée in paris (sctories reaching not less than 40,-0, a total of 165,000

Hand in hand with this increase in money value. ranne in mand with this increase in money wate, we find improvements in manufacturing processes. Five years ago, where a man would have paid from \$3,000 to \$2,500 for a tonring car, or \$850 to \$1,200 for a remaind the scarcely expreed to get much in the way of darability, or if he did, in the exuberance of un-sophisticated anticipation, he was almost sure to be disappointed before he had used the car many days. When we recorded the antomobile runs of those days when we recruded the antomobile value of those days in these columns, we susually had to recibe a series of troubles of various sorts, chiefly with tires carbureters, ignilion devices, as well as breakages and imperfect functioning of valve mechanisms, sharts, goars, chains,

steering knuckles, driving arise, and other vital parts. Contrasting this condition with the results of the Gildden Tour of 1909, we find that thirty cars took Glidden You'r or 1909, we mad tant three care took part in that run and finished an arduous trip of 3,404 miles in 15 days, at an avarage speed of twenty miles an hour during the daylight running periods, without making a single involuntary stop. That tells the tale of the wonderful technical improvements which have been efforted in the brief space of a few years. It is rarely indeed that repairs are made during runs now-

rarely indeed that repairs are made during reas now-days. Occasionally a brake, a reduceter, as ignition system, may have to be adjusted, or a tire may blow out, but the care operate amountly and irrustworthly. The introduction of special grades of steel, aimmin inn, vanadium, and babhit, all of them endowed with defailst physical properties peculiarly united to the conjuments of automobile manufacture, have wonerfully improved the quality of the motor car steel and chrome-nickel steel are now used in craph steel and chrome-nickel atcel are now used in crans-shaffs, transmission shafts, driving axie, driving and differential atcering gears, steering knuckles, and simi-lar parts, manganese-bronse, phosphor-bronse, and various aluminium alloys find their places in crankcases gear boxes, eteering gear housings, and parts de-manding great stiffness combined with light weight. The automobilo industry is very largely responsible

The automotic industry is very larguly responsible for the discovery of the physical properties of chroma-nickel steel and vanadium-chrome steel under different modes of heat treatment and for the introduction of special tool steels required to work them, and has thus indirectly benefited the metallurgical industry of this country As a result of the employment of these new steele in the sliding gear sets, by way of filustration, stores in the sitting gear sets, by way of illustration, it is now possible to transmit the 40 and 60 horse-power of the modern touring car with emailer and lighter gear sets than were used in cars of 12, 15 and 20 horse-power five years ago, and that with much greator certainty against breakage and the practical elimination of the mangling of the ends of the teeth by meshing and of wear due to contact under load. All this improvement in quality, plus infinitely more grace in general lines and in comfort to the passengers, is in general lines and in councry to the passengers, is offered to the buyer aimest at no advance in cost over the ungainly, unconfortable, and poorly-equipped care of all and seven years ago it is safe to say that a great proportion of the automobiles manufactured in 100 will be inwyriced care. The car that could be bought a lew years ago by the man of moderate in-come resulted close attention. Automobility at that come required close attention. Automobiling at that time was unquestionably a diversion for the rich Nowadays a man of moderate means can purchase an use a car at an expense that le well within the b

In the early days of the automobile industry, the manufacturer was under the necessity of making all his parts, to-day the factories actually making even 75 per cont of the parte that they use are in small proportion to the number of producers. It is to these changes that the excellence of the medium priced suto mobile is largely due. There was a time when an as-sembled car was undoubtedly open to suspicion, for however desirous a maker of its parts might be to do good work, he had notther the knowledge nor the facili good work, he hed nother the knowledge nor the facilities that would make it possible These anne companies nor possesse enurmous plants. Their designers and equipment are the hert obtainable and their products embody the latest and best in practive, workmaship, and material Assemblers now bave at their command parts of a high degree of excettence, and (an buy them at prices far below those charged for the weak and faulty product of former years.

When a monufacturer turns out twenty thousand cars a year it is not only justifiable but necessar him to invest very considerable sums in special ma chinery of all kinds that for a smaller output would be inadvisable. One manufacturer has spent \$40,000 for dies to produce a rear axle housing, on a production of one thousand cars, the charge against each for tion of one thousand cars, the charge against each for this would be \$40 With an output of twenty thou-and cars, however, the charge of \$3 against each is little enough for the purchaser to pay for so excellent

A recent development that illustrates the endeavor to reduce manufacturing costs is the establishment by some of the leading producers of assembling shops at ducers of assembling shops at the large centers. To these are shipped part tity to build the cars required for that locality, and as there is no equipment of machine to the expense is slight. The freight rate on unas nt of machine tools the expense is single. The Freight rate on unassem-bled parts is much lower than on complete cars, and the saving effected in time and convenience as well as in monay makes the system a satisfactory one. Vast as the automobile industry is, huge as is the vaine of its output, it must not be supposed that the

value of its output, it must not be supposed that the protist are illegislants. It is said to say that the present-day manufacture of medisappriod care makes a lettimate profit of the of the largued producers and a lettimate profit of the largued producers are in lettimate profit or care is less than \$100, zeroly not excessive when one considers its secondous investment in magnitude and parts, his vauly vast equipment of, machine tools, and his labor expenses. is labor expense.

It has been said that any average engineer our de-

eign a our to sell at \$4,000, but that the greakest of is necessary what the selling price is to be less of \$1,000. Perhaps that may account for some of the coedingly eleyer designing in the low-priced cars. The scene of the industry has shifted in the year

The scene of the industry has shifted in the years from 1885 to 1910. Much of the early experimenting in motor cars and early manufacturing was done in Buffalo, Tarrytown, Marion, N J, Bridgeport and Hartford, Coun, Philadelphia, Pa., and other Enstern States. At present Michigan tends all the States in States. At present Michigan leads all the States in motor-car manufactoring, for that State last year made 113,000 of the total production of cars for 1908. Your other States adjoining it will produce 75,075 ma-chines at least. The Middle West may therefore be said to be the real home of the anton dile industra at the present time It controls not only the car-mak ing industry, but the making of tires, parts, and access sories as well, a condition which is primarily due to the industrial enterprise of the smaller communities of the industrial enterprise of the smaller communities of the Middle West, who have given land and in every way furthered the making of automobiles. It must also be considered that the makers of automate imachinery are very largely situated in the West, for which rea-son the better class of aktilled labor is there to be found Lastly, the shifting of the industry from the East to the Middle West has been caused in over a East to the Middle West has been caused in part at least by the fact that the raw material is there put through its first and second processes, as in the case of rubber, steel, leather, wood, brass, and the like That the Middle West is undoubtedly benefited by

the indux of automobile manufacturers can be shown by the wonderful increase in the population of some of we wonnersus increase in the population of some of the smaller town. The infine of 2,000 to 5,000 families has doubled and trobled the populations of such olites as Filmt Mine, and Newcastle, Ind., and greatly en-hanced the value of real estate. Towns which were practically unineard of before the automobile entered into our deliy life are now thriving centers of inpractically unheard of before the automosus enterer into our daily life are now thriving centers of industry Communities with a population of only five or six thousand have their names brought home through the magazine advertising page to millions and millions of readers, simply because they are the and millions of readers, simply b sites of large automobile plants.

Cost of Various Methods of Illumination.

The Frankfurter Zeiting publishes the following remarkably complete table of the cost of various ethods of illumination

Cost of 100 normal candle hours

	Cents
Washington light	0 238

PFITENER'S MONOPLANE.

To the Editor of the SCHRTIFIC AMERICAN

1 have just read with much interest an article in
your issue of February 12th under the caption "A Novel American Asroplane."

The monoplana has always appealed to me as being The monoplant and always appealed to me as being more consistent with the laws of nature, and therefore more succeptible of continued improvement and evantual perfection, than the biplane. The double of triple planes strike me as being contrary to the examples planes strike ma as being contrary to the examples set us by Nature, the artra planes being a superfluity of which Dame Nature is rarely, if ever, guilty it would be an incongruity for a bird to be supplied with more than one pair of wings, unless the duplex or triplex wings were acrompanied by a Siamose-twin or triples wings were accompanied by a Siamese-twin or triplicate body. As long as there is hut one body and one source of motive and controlling power, a single pair of supporting planes would appear to be all that is necessary if the planes are sufficiently extended to support the body at the speed normal to the bird Additional planes do not sufficiently compensate by their increased buoyaney for the increased weight unwieldlincreased buoyancy for the increased weight, unwheld-ness, and instability I therefore pin my faith to the monoplane as likely to afford an additional illustration of the fittest " the Darwinian theory of "the survival of the fittest"

of the situat" in Figure 2 design, according to my ideas, comes her Pfitners's design, according to my ideas, comes nearest to the ideal heavier-than-air giving machine than anything that has berestores been brought to my attention. I will be greatly mistaken, and disappointed as successful, if we do not bear from his machine ere long as accessfully rivaling aven the best of the hiplanes. But over Mr Pfitners's novel design is susceptible of improvement I cannot help wondering wby neither he, nor any other validors as it as at have been shill be the contract of the co

he, nor any other aviator as far as I have been able to observe, has adopted what I consider to be a very essen tild element of stability invarishly to be found in the make-up of the deminant of the air. I mean the invari-able disposition of the veight of the body to the sup-porting planes. Mr Pittners seems to have entired ignored this principle, like all other aviators, by placing his engine and driver's seat above or on a lovel with the supporting planes.

Nature, on the contrary auspends nearly the entire eight of the bird below the level of the wings or weight of the bird below the level of the wings or planes, ordeatily for the express purpose of securing stability. During flight, or particularly while searing, the extended wings of the husant (it adopt a familiar of their juncture with the body, while at the same time the head is lowered and extended forward, so as to bring it down to or beseath the plane of the wings While the bird is salling in a calm atmosphere, the legs and feet are drawn up toward the body, but it do a sudden gave of whel at the cut of the wings as a sudden gave of whel at the cut of the wings as the same time. to displace the center of gravity, the legs are at once oxtended in order to lower the center of gravity, and equilibrium is at once restored. This seems to me to be a wise provision of Nature worthy of imitation as

far as in practicable by the aviator.

With the engine, an apphibe and water tanks, as well as the seat of the aviator, rigidly suspended as far as conveniently possible below the planes, the weight acts litte a pendulum, the plumb-bob of the massen, or the ballast of a ship, its constant tackery being to restore the equilibrium of the planes the moment the disturbing force is removed. And in making a change of direction, if the radius of the surve is about the standards of the curve in about the standards of the curve in about the standards of the survey in a about the standards of the survey in a should the standards of the survey in the survey a change of direction, if the radius of the curve is abrupt, the endency of the outer plane to rise on account of lie increased speed as compared to the racted speed of the luner plane will be measurably combracted. With the weights so disposed, the exceeded planes will set like a parachete, and in case of the sadden breakdown ut the segtime or properly the combracted with the section of the sadden breakdown can be set to be set of the sadden breakdown can be set of the section of the sadden can be set of the section of the sadden can be set of the section of the sadden can be set of the section of the sadden can be set of the section of the section can be set of the section of the section can be set of the section of the self or his aeroplane

seif or his aeropiane
Were Mr Pfitsmer to raise his planes to the tops of
the vertical posts, and lower the engine, tanks, and
seat to a level with the axies of the carriage, he would
find that much less skill would be required to preserve find that much less skill would be required to preserve the equilibrium of the machine Possibly the propeller shaft about remain on a level with the planes, but if lowered just far enough, to esable the hindes to clear the ground, I apprehend he would be table to clear the ground, I apprehend he would be table to clear the ground, apprehend he would be table to plane unward would assist it in leaving the ground, once sedact, that tendency, if presisted its, conditionally the constructed by the proper use of the forward brainfast grader, without perceptibly impeding the property of th

would suggest another scheme for the rudders them be connected together, so they would more mison. When the horizontal rudder is always of in union when he horizontal ruddor is newtood or depressed in order to rise or descend, it would make no material difference if the perpentitedar rudder did she rise and fall in a perpendicular plane. It would produce no change in the direction in like manner, if the perpendicular reader should be turned to the right or left in order to alter the course, it would have no influence on the elevation of the machine. I possess but a superficial knowledge of aviation, and I have no means for investigation or experiment, but I have been intensely interested in the scloses over since the Wrights' operiments were first made The above thoughts came to me as I read and

pondered the description of Mr Pfitzner's novel device I make bold to offer them to you for publication if you deem them worthy of being embals C E McClura

THAT BUMBER PUBLIC.

To the Editor of the SCIENTIFIC AMERICAN
If your correspondent in the issue of January 22nd will study the following figures, he will plainly that it is not impossible to get 35 sets of 3 out of 1—15, so that no two numbers will be in the same set more

1-2-3 2-4-10 3-6-11 4-9-12	6 912
1-4-6 2-5-11 2-7-12 4-13-14	6-10-14

REBUILDING THE "IDAHO" AND "MISSISSIPPL"

Tu the Editor of the Scientific American As one of your readers, I have been for

Interest the proposals put forward by various gentie-men regarding the reconstructing and rearning of the different types of pre-dreadnought battleships in

in the March 5th number of your paper you published a letter from Mr W W Bass concerning a proposed rebuilding of the battleships "Idaho" and Mississippi' so as to make them usariy equal to the Louisiana" class. One of the objections put for ward was the impossibility of establishing a 10 inch gun in a turret built fur two 8-inch Why not ave gun in a turret built fur two k-linen why not avoid this difficulty by leaving the night 8 line, guns airready mounted where they are and then to increase as much as possible the 7-linch battery below? This would make these ships even more similar to the "I-Justians". I do not believe that the catting in two of a haitie-

ship would entail very great difficulties as a few years ugo a White Star liner was cut in two and a new bow hullt on the original baving been destroyed by an accident. A torpede-boat destroyer of the Brit ish uavy also was rebulit in this manner

But if it was deemed too expensive to build this section as proposed, would it not be feasible to sarri fire a few 7 luch guns and re-engine the ships with turbines of greater power thus attaining the extra knot and a half necessary to bring them up to the "Louisiana's" speed standard without the cost, time, and labor of totally rebuilding them?

New York, March 21, 1910

[The "Idahe" and "Mississippi" are so much shorter than the "Connecticut' that there would be no room for the mounting of additional 7-inch guns It would be useless to in stall turbines in the increasing their length and the cost of both changes increasing their length and the cost of both changes would not be warranted by the advantages of addi-tional 7 inch guns and the greater speed secured thereby The deficiencies in these ships are due to the artion of Congress in limiting the displacement to 13,000 tons—Eh.]

Boath of Alexander Agnesia

Prof Alexander Agazets died on the steamer "Adriatio" on March 29th, white on his way to New York Hardly tens famous as a scientist than bis father, be Hardly less famous as a scientist than his rather, be was noted not only as a biologist hat as a mining engineer financier, teacher and man of the world. In his life he combined the activities of president of the his life ho combined the activities of president of the Calumot and Heck Mining Company and director of the Museum of Comparative Zoology at Harvard, founded by his father Prot Agassia was born in Neuchatel in 1855 and did not come to this country until he was fifteen. His early education was re-ceived in Europe, attempt he was produced from Rayrard with the class of 1855. He sharted by the life as a civil engineer, and did much valuable work as assistant on the Atlantic Geodetic Coast Survey Elis work in that field naturally drew his attention to the natural sciences. He began to collect fishes for his father, and thus was induced to follow in his father's footsteps. After that his activities were at-most equally divided between scology and mining

ndy of the copper mines of Poru and Chill led A study of the copyer mines of roru and Chini sea him to a survey of Lake Titicara, and also to collect Peruvian relics, which are now lodged in the Pea-body Museum at Harvard Five years of his life, from 1876 to 1881 he spent in deep-sea dredging ills blo-logical survey of the waters of the Cuif of Mexico and

the Caribbean Sea is still regarded as classic

His exploitation of the Calumet and Hecla mines to his profit secured the means to gratify his fat ambition, the erection of the great Harvard Mu of Comparative Zoology

or comparative Zoology
He made by his persistence and ability in argument the development of the Lake Superior copper
terrilory on Keweenaw Point (and now later traced to the mainland) a certainty

Beath of Hermann Muedabook.

Oberstleutnant s D Hermann Mordebeck died re cently With him there has passed away one of the most ardent advocates of acro-navigation Thanks to his efforts the Deutsche Verein fuer Luftschiffahrt is cluded in its programme meteorological measurements.

As a young lieutenant, Moodebeck became a member of the Deutsche Verein zur Fördorung der Luftschiffahrt. As a captain he founded in Strashurg tha Oberrhoinische Verein fuer Luftschiffahrt, and pub-Observations and the version that I discontinuary, and published its official organ, liturative Accountantiache Milteliungen, now the official organ of all the German aeronantic societies in 1907 Mondebeck was promoted to Obsertieutanta. A year later he rutter from active army service in order to devote his entire time active army service in order to devote his entire time to aeronautics He was a momber of the luterna-tional Commission for Scientific Aeronautics and a charter member of the International Commission of Aeronautic Majes it was only recently that he founded an zero Lutthottenversin fuer Berlin und Branden

Beath of Galen (lark.

Galen Clark, who died in Oaktafil Cal, ou March 24th, had been known for the last half century to almost every tourist who has visited the Yosemite Valley While on a hunting trip in 1857, he discovered valley while on a untring trip in 18st, no discovered the great rodwood grove at Mariposa Boon after that Clark devoted much of his time to exploring the upper heights of the Sierra Nevada Mountains, and made known to the world much of the beauties and wonders of the hig tree groves and of Yesemite

The Current Supplement.

In the current Supersynty, No 1788, Mr P M'N Bonnie reviews the recout work which has been in the electrical reduction of iron and steel There is much contrasion with regard to dyestums and the colors which they impart to the testilis fainty of the testilis fainty of the testilis fainty of the Sone very interesting movestites in toy are described and illustrated Lieux, John C Solely exhaustively additionates the oil fedds or the Gulf of Mexico and the contrast of the Court of the C is much confusion with regard to dyestuffs and study of the sun is concluded Halley's comot is now visible to the naked cyo just before dawn in the east-ern sky, for which reason Mr George F Chambers's most thorough article on this interesting wanderer is published with peculiar timeliness. One of the most important articles in the Supplement is Mr Aston's acrount of the recent Olympia aero exhibition by far the biggest of its kind which has ever been held in

According to the Engineering Record improved boller perferensive has been sitalized at the Anderson station of the indiana. Union Traction Company by preventing the leakage of air from the subjust around the ends of the chain grates into the flues. This is accomplished by first fining at lanh outra-bacy pipes arosa the frames 8 inches from the rea-of the grate, with its lower surface 3½ inches show the top of the grate. There is a zone of about 10 inches between the center of the pipe and the rea-fre box wait, which is covered with a course of fir-brick. This shelf prevents the passage of all which the pipe holds the body the course of all chains. boller performance has been attained at the Anderson burned into ash, which the grate can carry back under the pipe in the desired manner. Inside the 4 inch the pipe in the desired manner inside the vipe in one of all nich diameter running from one end mearly to the other. Cold water is admitted through the small pipe and flows back through the large one, the rate of flow being adjusted so that its final temperature is just under the belling point. The hot water is discharged in a way that permits its condition to be inspected, into a beader delivering it to

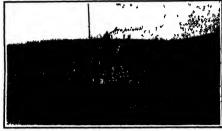

OUR SEACOAST DEFENSES'

CIVII. DAY OUR

ITS ARRIVAL ON AND PROGRESS AROUND THE EARTH BY DANIEL ARTHUR

A few generations before our era the "whole known A res generations source our cracker whole know world was only some 2 million square rather in extent desired of nearly 2on williams as we now know That great observer and geographer Fratoschenes made That great observer and geographic Frincoshenes made a noble ultrarial about 25° In C in draw a map of the "World" in even used lines which tooked very like parallels of initials and ijriks of longitude These lines were largely based on the speed records of traviters and hance were not very accurate There were no such refinements un his non international date lines or time zones. His gendig wide cost and west by 60 deg long nurib and south It was all above our equator, and extended only about a quarter of the way around the earth

nertiar west and note some related conspect on the northern seed of the Nettermann, has senger on the northern seed of the Nettermann, has seen at the new particular Magelian trassed the Atlantic from the east he pussed around flouth America crossed the Parlitt, discovered the Philliquin Islands, and went home around the lower end of Africa thus completing a trip around like world. This trip was made less than trip around the worm that trip was more easy than four hundred years ago, yet when the explain is arrived at their home country they were astonished to find that they carried a date on board their slilps which tast oney carrier a onto on court mere stills want on was a lay earlier than the home date. It was soon found that no mislakes were made on the log books as to the time records and that the home calendar was cortainly correct. The explanation of this seem

to a set of questions sent by the writer. The map, together with the questions and the answers, will be found on a recent Paulin chart issued by the Navy Department To describe the line, commencing at the northern end, it will be seen that the first deflection of practice is to the cast, to give the tip of

liceretical state line 2 Date line when Alaska took date of Russia as Philippines took d. is of Pintis 3 Date line after purchase of Alaska and Philippines took Asiate date 4 Present international date line

Fig 1 -The evolution of the international date time

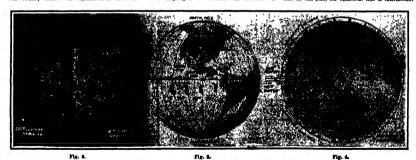

pir Then after the line passes through Bering Stratt it hears to the west, crossing the true line of 180 deg and far enough beyond it to take in all of the Alculian islands to the American date, after which it turns back to 180 deg , where it stave until it cross turns back to 180 deg, where it slays until it crossess the counter a few degrees, at which point it again deflects enstwardly to give the Tonga islands the date of Australia The line then returns to the 180th nieridian and continues on that line to the south

The foregulng is the 'international date line' of

1848, to bring those inleads into accord with the date of the countries east of the Cape of Good Hope. When Alasha was acceled by the United States, the date line was translared west of their territory or into Bering Strait. These two radical changes mades the Bering Strait. These two radical changes mades the Bering Strait. These two radical changes mades the Pig. 1. Netor to Pig. 3, which is intended to show the entrance of time on our globe. The picture illustrates a machesized deletery of our civil day, month, year, or century by means of an equa torial tape. Let us assume that the earth is stationary and that this tape centers and despars under the date-line reliers as shown. If the tape had a speed of about 1,040 miles per hour and we, it would show just how our civil day onners the earth and progresses around it with a constant motion would show just how our civil day onters the earth and progresses around it with a constant motion. The illustration shows the front end of the twen titch century as having completed is hours of the first day on earth, leaving only 6 hours of the ninciscenth rentury to gifled toward the line and off, to no one knows where Tha front end of off, to no one knows where Tha front end of off, to no one knows where Tha front end of off to relate it is the door to relate it, just as December 3 let steps out. door to enter it just as December Siet steps out, as it were Then we have the twentieth century all over the carth with January lat reducing its equatorial width at the rate of some 17 miles per minute and January 2nd growing breader at the same velocity. This of course is assuming that time is entering normally and not by the arbitime is entering normally and not by the arbitrary intermittent steps that we will call the twenty four way stations of our civil day. This latter system is in successful operation in the United States and two or three other leading nations. China being one of the more recent converts to the hourly sone system.

vertate to the hourly some system?

Fix 3 shows the earth with the hourly time betts or some outlined from pole to pole. The lines draws are 15 dee, part and represent the boundary lines of these somes and sight their location. Fix 4 is the same expelled as viewed from the north siar In high little-criticals between triblens the United States are outlined in suproximately the correct tocation, as as to show the insertical boundary lines of the hourly somes as insertical boundary lines of the hourly somes as to show that the second of the seco drawn and what our United States are actually using in theory To illustrate mechanically the delivery of time on this plan, our equatorial tape is intermittent

The distance from the crank plu to the center of the wheel however, is fixed in use the automobile engine is op-erated to rotate the wheel, and this action carries the pision up and down in a cylinder, the latter rocking back and forth to accommodate itself to the lateral throw of the crank pin A flexible tube connect the throw of the crank pin A flexible tube connect the pump with the fire that is to be inflated. By this ar-rangement a tire may be inflated vory rapidly, and the inflation carried to a further degree than is pos-sible by the manual operation. By using a speed at inchment of any of the well-homour typos, the burst ing of (fires due to accessive pressure may be avoided fris investor of this automobile jump) is Dr. Richard A. Goeth of San Antoulo, Toxas.

COLLECTION BOX FOR MAIL CRUTES.

Collection boxes at the termini of mail chutes are frequently filled to such an extant before the mail is removed that when the collection is made the mail tumbles out of the box on opening the box door and tumbles out of the box on opening the box door and falls to the floor in spile of every receasition taken by the collector. To better this bethersome condition a box has recently been devised which is previoled with a platform having foldsake side walls that permit the platform to every developed when the door of the box is opened and serve to prevent the smill matter from failing from the box. The countractions of this

COLLEGRICH BOX FOR MAIL ORUTES.

box is clearly shown in the accompanying engraving Fig 1 shows the box door open with the platform A swong down horizontally The platform is provided with two side wall plates B rigidly securwith two able wall plates B rigidly secured thereto and a sertice of sector abapted plates O Near the for-ward edge of each of the plates B and C is a groove D adapted to receive a pin mounted on the adjacent plate, while at the opposite ends the plates of each side wall are mounted on a cummon hispe pin This parmits the side walls to close up somewhat after the manniar of a fun to the position induced to Fig 3 The incurrence sector G is provided with a long S, which The innermost set for C is provided with a jug E, which engages a lip formed at the top of the bex and limits the outward swing of the platform A. To percent the interest of the control of the bex is provided with two guards F which extend below the upper edge of the plates. In such exhen the platform is lowered the letters in the box will turn be out through the door opening and will be caught by the platform and side walls. The investor of this content of the control of the contr care of T J Kelly, 29 South Eleventh Street, Lincoln,

A NEW SOUPDING POARD FOR PLANCE.

The soul of a plane is its sounding board That
sunding board is composed of wood carefully selected and carculty seasoned, so that it will remain constant in quality for the many years during which a plano is used. It is srehed or crowned against the pressure of the strings so that the strings and the so ing board may vibrate in harmony As the plane ages the sounding board flattens. In an upright plane this flattening is accompanied by 'buckling back" or cracking The result is that hard motallic so-called "tin panny, tone so characteristic of old planos it is obvious that if some means were provided for permanently arching the sounding board against the pressure of the strings, the plane ought maintain its tone for years without any tendency of the sounding board to sag

The attempt has been made frequently Some auployment of tension rods radiating from a center hub to the sounding board rim, but so far as we are aware to the sounding noard rim, but no rar as we are aware no one has ever successfully equipped the upright plane with a sounding board so constructed that it sould not lose its arch in time A sounding board or this type which has been successfully applied to an upright plane has recently been invented by Mr Frank B Long of Los Angeles Cai and is illustrated in the accompanying engraving
What Mr Long has done can best be understood

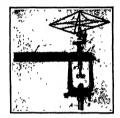

TRUSION DEVICE FOR PLANO SOUNDING BOARDS

when we consider the true function of the sounding when we consider the true function of the sounding beard of a plane The sounding board serves to sus-tain and amplify the tone produced when a lansmer strikes the strings. He Long has increased the ton-suataining and amplifying quality of the sounding board by firsthic reinforcing means interpreed be-tween the sounding board and the sounding board frame, thus equalities the installity of the wounding frame, thus equaliting the next builty of the sounding board and at the same time maintaining its ristion to the sounding board frame, so that the greatest po-sible vitailty of the sounding board is insured From the accompanying illustration, which shows the front of an upright pisno with Mr Long's sounding board of an upright piane with Mr Long's sounding beard in position, it will be observed that the edge of the sounding board is subjected to pressure from screw posts interposed between the other of the sounding board and the beary back frame "The pressure is or condensation of sound waves in accordance with the principles suggested by Heimboltz in his work on Bennation of Sound" Busides creating this reflect ing effect, the pressure post serves the additional pur pose of maintaining the crowned sounding board in The back frame supporting the its original form unding board is reinforced by diagonal tension rod tood across each corner, as shown in the illustration

The edge of the sounding board is rabbeted and used into a continuous laminated rim built up of hard maple veneers or layers so as to produce as exceedingly strong construction, which, however, is sufficiently fiscible to yield under the pressure posts, with a view to equaling the outward pressure on the sounding board resulting from the stretching of the sounding occur resulting from the stretching of the strings over the surface. By the use of screw pres-aure-posts, any shrinkage or expansion of the sound-ing board and the rim can readily be equalised so as to preserve the tone and even to amplify it 'ho arrangement is such that a proper reflection of the vibrations of the sounding board is obtained, as the strain on the sounding board by the strings is equalized to reflect the tor

As a possiti of this new combination of sounding board rim and pressure posts a small upright plane can produce a tone which is comparable with that of nail grand plane, and the full round tone of the new unright plane is preserved because the sound ing board is maintained in its original arched post-

EDUCATIONAL APPLIANCES FOR DISPLAYING OBJECTS. In the instruction of projection mechanical drawing, descriptive geometry, etc., it is important to be

EDUCATIONAL APPLIANCES FOR DISPLAYING ORIECTS

able to show students a skeleton model of an object. large enough to be seen by an entire class, and which will show front and side elevations as well as plan and bottom views. Heretofore this has been done by using a glass box within which the object was placed, or by using wire screens for the sides of a lox, which per mitted the teacher to chalk mark the outline of the object. An improvement on this system is offered by the invention illustrated herewith it consists of a stand provided with axes that have automatic stops at quarter revolutions to arrest the model in various positions The apparatus comprises a vertical shaft A. on which is mounted a table R that carries a support G, provided with a pair of upwardiy extending arms. The support C has in its lower face four revesses adapted to receive a spring pressed atop pin D. The revesses are positioned at quarter revolutions of the support. nted in the arms of the support is e shaft on arounced in the army of the support in a season to when the serve secured the square blocks E and P. The block E is formed with four recesses adapted to receive the Bin G. The blocks are adapted to receive a clamp If that carries the display stand J. Model K is shown supported on the study. First display stand may be moved about on three knew which are sitted with index els so es to incline or turn the model about to any where so we unreal or the discontinuous desired angle. The inventor of this oducational appliance who is by Hermann Haustein of 2019 Mohawk Street Chicago, ill. Informs us that he has used this display apparatus effectively in his own classes.

IMPROVED DETACHABLE WINDOW VENTILATOR

The vontilator which is illustrated in the accompanying engraving may be detachably secured to the window casing so that the window may be opened a short distance to permit the entrance and oscape of

IMPROVED DETACHABLE WINDOW VERTILATOR.

RINGING CRIMES BY PRRPORATED MUSIC SMEETS. time of the pioneer inventors of the automatic plane player, Mr John McTammany of New York city, has a system of ringing chimes of bells by p ferated paper music sheets, such as are employed in pisno-playing mechanisms. Mr McTammany's scheme was evolved as part of a huge memorial to be erected to the memory of the men who fell in the civil war to the memory of the near who fell in the civil war. The memorial assumed the form of a monament in which such Bitale was to place two bells. To rings so extensive a chine by hand would obviously be a task involving superhuman meacular power, Eres the present mechanical and electrical methods would probably full because of their complexity Hence, lift Wichmanny deviated the very impanious gyrdem which were the properties of the complexity of the control of the control of the complexity of the control of the con

McTanumary devised the very ingenious system which is brer illustration under about A is guided by a roil B, and passes over a growed roil O. The pins of a dering wheel D are adapted to engage the perforations of the music about A. The pin wheel D is operations of the music about A. The pin wheel D is operations of the music about A. The pin wheel D is operation of the music about A. The pin wheel D is operating of P, a row is about Q, a connecting roil P, and an angle tripper JE, with a primary stap, wheel L, which consists

the bell R The several shafts litustrated are geared together in such a manner as to cause the several parts to co-operate in definite order

A toth of the wheel D having salered a groove of the feed rell of through a perforation in the music sheet A, the wheel D turns on its shart. In so doing it engages the dog S, which is turn through the con-necting road F and B trips the angle tripper JK, thus releasing the secondary star wheel L, which, by the releasing the secondary star wheel L, which, by the shift of the shart, rotates into congenement with the side O, thereby pulling the sided dewn and withdraw-ing the chapper from the bell Whan the sides are tis secondary to the star wheel L, tha retra-cise of the chapper is the side of the star wheel L, the retra-le spring of the chapper is the side of the star the part dies the side roll, and is prevented from rotating ex-cept when one of its teeth fits into a perforation of

RINGING CHIMES BY PERFORATED MUSIC SERBIS.

the sheet and into the grooved rell, which turns the primary star wheel one degree.

The playing of the bells can be governed by clock mechanism, so as to strike the quarters and the hours and to play airs at stated intervals.

A new form of necessary interrupter has resembly been invented in which there are not reciprocating parts, but the interruptions are produced by a ripple formed in a siresan of movement. The mercury is contained in a reverleting vessel within which a contact-piece is fixed. The mercury is thrown by contributed not never in the property of the vessel. At one point the stream of mercury is obliged to pass over a contact piece the interruption contains a ripple or wave, and the contact piece of the interruption of the interruption may be varied by making the deficient revolute slowly in the same directles as the vessel it revolves why in the same directles as the vessel it revolves why in the same directles as the vessel it revolves the containing of the high points dispositly dispositly, in latting it.

305

It is Easy to make advertising

claims for cars; but to make cars that will make good the claims is hard.

We ask automobile buyers to do this: After the advertisements have attracted your attention, then in fairness to yourselves and all the manufacturers, compare the cars point by point. That is all we ask.

There are Chalmers dealers in all parts of the United States—more than 200 of them. We suggest that you get in touch with the one nearest to you at once. Let us send you his name if you do not know him.

Chalmers "30" \$1500

Judged by price alone you might as well buy some other car as a Chalmers: \$1500 is simply \$1500—no more in one bank than in another, no more in bills than in coin, no more in your pocket than in another man's.

It is only when you begin trying to buy something with your money that the sense of value enters your mind.

Your \$1500 is worth more than another man's \$1500, if at all, only because you are able to buy more with yours than he can buy with his.

We believe that when you buy a Chalmers "30" your \$1500 becomes worth more than \$1500 invested in any other car. Careful investigation will convince you of this fact.

Please remember you are not buying a price or an advernuement: you are buying a car. Therefore examine the car on its merits.

If you investigate thoroughly a Chalmers will be your first choice, if you are able to get a delivery in your territory.

It is difficult to get more in a car, at any price, than you can get in a Chalmers "Forty" at \$2750. The "Forty" has all the power one can want, the quality to endure, beauty of line and luxurious finish. Seats for seven if desired. Catalogue "R" on request.

the terest corrected for wind drift,
travia to Many authorities conside
cred mortars in past years in bis so in
accurate as not to authorize their construction but within recent years the results of feels and the records of tay get practice have shown that mortars are of immenso value to seaconst forti-fications. Several companies in our coast artiflery have made as high as 30 per cut litts at ranges of six and seven thousand yards when firing on a mov-ling largel baving a speed of seven or right miles an hour and when firing but one morter at a time Mortnes have a particularly great value in repelling a reconnoissance in force as they can be lived with impunity without disclosing thoir location
Another important arm, if not the

most important arm of defense in the count artillery, is that of submarine minus. These weapons are designed to repel an altack when the bostle fleet the guns have been put out of action The system is so designed as io rende mines harmiest to friendly ships and to be under such perfect co the mine commander as to permit their being fired either by contact or judg ment The emitted principles involved in the control and fing of submarine mines is kept a secret. Ten years ago it took almost two weeks to plant a group of mines To-day, by the use of mine planters, a harbor ran be com ely blocked within twenty four hours

The work that will devolve upon coasartiflicry troops in time of war will be of the most trying and patience-racking

It is presumed in making this state ment that no fleet commander would attempt an open attack or "run by in broad daylight but would await the esrbroad daylight int would await the ear-ity dawn in a partial fog, when search-lights are useless and the spirit of the men at the guns at its lowest obb ile would, without doubt, wear the gunners and canoneers out and try their pail cince by making many sortles and feints during late hours of the night and car-ly morning before making his final atty northing occurs making its man ar-tack. He would also if possible await his attack until cold weather set in and snow had failen, knowing how dispir-iting ice and snow are to soldiers living in tents, as they would have to do during War

in the harbor of New York, for example. If war were declared all coast artillery would have to live in tents im-mediately in rear of the guns.

Would it not tend to haved discontent Would it not tend to hreed discontent and dissatisfaction among soldiery if they were required to answer "call to arms" every hour during the night for about two weeks in bitter winter

This is the work the coust artillery will have to do whan it is called to de-fend our country's ports from the invasion of a foreign unvy

It will be then that the 'brave the

OUR CIVIL DAY. (Continued from page 202.)
particular day stays on the world (the entire world) for an exact hour
Let us trace the front end of the twen-

tieth century by this system of progress. We again show it as having reached its eighteenth hour on earth as in the former illustration. That is to say, it has reached the 90th meridian west of Green illustration. That is to say, it has reached the Sub-meridian west of Greenv wich, or central time, but as entirel reached the sub-meridian west of Greenv with or central time, but as entirely to FT/8 deg, west, making it arrive there had an hour too soon. We then compel it to stay there until it is a half hour monatain time, which lands the lat with the sub-meridian time, which lands the lat with the sub-meridian, and so on. By adhering strictly to the system, let us not what happens when January let reaches 150 deg. Of course it must cover the 15-deg, some, the onsite of which is 180 deg, thus transferring the "international data lime" to the thereby moved T% dee ahead of the 180-deg true line.

Before proceeding with our examination of the ragged date of time, which local convenience demands on the boar

tion of the ragged edge of time, which local convenience demands on the hour zones or way rations let us giance has the distribution of the time to the the three times of the time to the three times of the time to the three times of the times of times also appear in a constantly characing and more exaggorated form on the way sattions (hour zones) We have noticed how irregular the front end of the treation to minute years and the times also appear in a constantly characing and more exaggorated form on the way sattions (hour zones) We have noticed how irregular the front end of the treatioth control years when the tentered the earth Now refer to Figs. 5 and 4 and see what hap, vond to it when it local convenience demands on the hour and see what hap, ened to it when it progressed around the earth as far as progressed around the earth as far as New York city, that is to say when it reached 75 deg west (the eastern time zone) The dotted outline of the United The dutted authine of the United Balance anables not now the Pauli Beach. Morida, abould be "ringing in" the new year and contury in unitson with New York city Not so Pain Beach is still on the interested neutry cleandar, and will be for another hour The beach down to belong there, but as the railway managers voted it into central time in 1833, it is not "had there by steel rails just as rigidly as the Tomostonian year and the new year that the work of the property of the p

I once referred to these some lines to a I once referred to these some lines to a riema as imaginary "Imaginary" and he, "I will never forget the lime I passed over one when going to California from New York My appetite was running a bit ahead of time, and I was impatiently bit shoad of time, and I was impateently waiting for the dining car to open up at twelve noon, as the time table said it would. The porter entered my car, and instead of the musical sounds of first call instead of the musical sounds of first call for luncheon on a dining car he shouted "Bet your watches back one hour." It his train had reached El Paso, Tezza, under similar circumstances, it might have left the tracks. That is the point when the

have left the tracks. That is the point where the western time some overlags to make an extent that it actually meets an estarty defection from the Pacific some. The perfect would have then called, "Set pure variable sheet two boars." To present who have not looked closely into this complicated subject, the first question that conser to their lips its. Way the loop the fact lite said some likes straight in practice as well as to theory the proper that the property of the complex of

There must be a mighty solid basis for the phenomenal success that has followed the E-M-F Company from the very first.

No other Automobile Concern ever has enjoyed the tremendous success this one has. The whole world knows and all the world is talking about

the Company and its cars, constantly. There must be a reason and it must be a good one. Even competitors admit that!

Everywhere, E-M-F "30" is first choice of that class of buyers who want all that can be had of efficiency. power, durability and elegance and comfort at a price under \$2,000. (E-M-F "30" sells for \$1,250 fully equipped with five lamps, generator, horn and magneto.)

The farther you seek for the reason for this greater popularity-for the splendid reputation achieved by this car in so short a time the more does it appear that after all, the car itself is the real reason.

Ten thousand people are daily engaged in selling E-M-F
"30" cars—largest sales force and the cheapest-for they all work for love. They are satisfied owners.

deg west of Greenvich passes right through your frost parior. You will therefore set your hall clock an hour for-ward and let your little mantal clock stay as it is now Very soon you would like to defect the line enough to at least pass cotaide of the walk. Then you see visions of a late delivery of milk for your breakfast, and request that the line sweep in the suit depot, then the rullway station, and finally that your of-fice be kept in the same son of priceder west of Greenwich p fice be kept in the same some of prictice. Take another glance at the eastern time some "That little bump on its even put there, and only to keep the line was put there, and only to keep the line and most of your neighbors were unaware of this deflection east of Maine is aware of this deflection east of Maine is a proof that the line benders did their work well if a very large percentage work and the second of the seco that their sone lines were bent, it would be time to bend them into some different

As some readers might overlock the fact that the astronomical day begins and ends at Greenwich at noon, 12 hours later ends at Greenwich at noon, 12 hours later than the beginning and ending of the civil or common day (the day we sleep and eat and work by), we should make it plain that all the illustrations and reit pain that all the iterations and re-marks apply to the civil one. The astro-nomical day is a clean cut straight line affair that needs no adjusting to prac-tice. The users of this kind of a day do not try to thrust its date line aside. The not try to thrust its date line saide The observatory at Greenwich was built right on this line and to make it more realistic a bronse tablet is set in stone with prime meridian (Zero Degree) engraved on it so that it may be seen and feit by those who visit the observatory

The Energy of a Collect Spring

The old question of what becomes of the energy of a coiled spring placed in suiphuric acid cropped up again before supparts and cropped up again before the Western Society of Engineers during a discussion on the conservation of en ergy Dr Steinmetz gave this explana-tion on that occasion

tion on that occasion

The heat produced by the chemical
action in a coffed spring when dissected
is greater by the amount of energy
actored in it than if the spring were not
under pressure. The amount of energy unner pressure The amount of energy which is stored in compressing the spring in best measure is so insignificant compared with the energy of solution that one cannot measure the difference calorimetrically but one can prove that the compressed spring propers that the compressed spring proove that the compressed spring process a greater heat in dissolving than duces a greaker heat in dissolving than the ancompressed spring, in an indirect manner The measure of the chemical energy is the electrical potential differ-ence if one dissolves from in an acid and the from in nader strain partly com pressed, partly not one finds an unequal corrosion due to local current between the different parts of the iron. If there is a local current it means that the difis a local current it means that the dif-ferent parts of iron have different poten-tial differences against the electrolyta-that is different chemical elimities, and the part under strain is dissolved first, showing a greater potential difference and thus a greater potential difference and thus a greater potential difference solution. Thus, if only a part of the spring were compressed, the other part inch, the compressed part would finactive not, tas compressed part would dissorted first in the sulphuric acid by the local current circulating between the two, showing that its solution gives more en-ergy than that of the uncompressed part.

Thomas Misson resently took out a patent on an improvement in his storage battery According to the patent the active material for alkaline storage batteries is impregnated with an exygen comment in a notation of a bismuch sull, then subjecting the material to centrings action, and afterward drying The orientees and the control mass in a solution of a bismuch sull, orientees and a first orientees and a first orientees are all the subjection, and afterward drying The orientees are all all solution, and stanty washed to remove the smooth of alkali.

THE WORLD'S FAIR OF THE FUTURE

all probability the city of San Francisco will lead an international exposition, or us it is more pagularly known at World's Fair to celebrate the opening of the Panama Canal in 1915 If the promoters of the fair are willing to prafit lessons of former expositions their efforts will be directed to making the coming fair notable not for mere bulk and arm but for its compariness and the gruning excellence of its carefully selected exhib the grantine excellence of the carefully selected exhibits. The trouble with many pre-time spacetions has been that they were big to the point of being wearl some and oppositions has almost in this direct tion was rewrited at the St. Louis Fair in one single imilding of which is taken and to the state of the sale of the state of if he wished mertly to waik past inc whole of the exhibits Wintever may be the interfor motive, the avowed object of these exhibitions is identicual. Therefore, they should contain only the most dis linetise and valuable results of the world a sciutific indostrial socialistical and constructive work And in this connection we would ask whether it almost an insult to the good tasks and intelligence of the millions that are solitized to enter such as exposition if a large section of its space is devoted to that cheap form of entertainment which was inaugurated by the notorious Midway Plaisance at the Chicago Exposition San Francisco will have a great opportunity by breaking away from certain false traditions to render this, the latest of the ex-positions something fatter than a mere plaything of the real-catate dealer the side show man, and the poli-

OYROSCOPIC EFFECT OF REVOLVING ARROPLANE MOTORS.

titure were certain conditions in the r fatal accident to Le Bloss which engaged that the gyroscopic effect of the motor may have contributed to the disaster. He was maing contributed to the diseaser. He was using a light immonlymn of the literfect tree driven by a finance resulting motor. The seroplane, although as more until the standard and its good working order beams unmanageable and turning counted to your, fell to personal context running as 4,000 revolutions per min until motor running as 4,000 revolutions per min ur, must have been considerable. A sudden turning of the seroplane in the right or left by the aviator counter of the context of t would produce a strong poward or downward gyro would produce a strong upward or downward ayro-scopic Highing tendency in the longitudinal direction if this tendency were aggravated by a gust of wind it is conceivable that the action would be unable to control the although mufficiently to prevent a complete upset. At the time of his fail i.e. illon was fly ing above the bay at San Sebasian Spain, in a high, gusty wind is it not possible that the joint action wind and the gyroscopic effect of the engir and propeller was responsible for the disaster? and propeller was responsible for the disaster? The tragic death of Is lagrange when he was using a monoplane equipped with the same type of motor suggests that his sudden upset may have been due, in some measure to similar scusses.

ARRESTS IN OUR OWN AND THE BRITISH NAVY I are frequently asked by correspond to give some comparative figures show ing the relative excellence of the shoot ing in our own and other navies. We would gladly do so, but it is a fact that there is no information regarding the makes of the world more difficult to obtain than this France and Germany, in partitular never giving to the world the, results of target practice Both the United States and Great Britain however, do publish such figures. But even here it is often difficult to establish accurate comp dom complete, either the range or the aise of the target being frequently omitted, and no statement heing made as to whether larget or ship or both were moving However, we offer the following compari-

ou, which is based upon official figures.

The Engineer of London states that the results for the past year have shown that each 12 inch and 10inch gun has averaged 063 hit, each 92-inch gun, inch gun has averaged 053 htt, sach 3 3-linch gun, 134 htts, and each 15 link gun 247 hits, these being the average number of hits per gun per minute for the whole navy The 6 linh 47 linch, and 4 linch guns varied from slightly over 4 hits per minute for the 6 linh 10 5 hits per minute for the 6 linh 10 5 hits per minute for the 1 linch 10 5 hits per minute for the 4 linch By the courtiesy of Rear Admiral Mason, Chief of By the courtiesy of Rear Admiral Mason, Chief of

the Bureau of Ordnance we are enabled to publish the average results obtained on all the guns on all the ships taking part in target practice in the United States navy Whether the ranges and the size of the largets corresponded to those in the British navy, we are unable to say The results are, for the 12 luch gues 972 bit per gue per minute, for the 10-inch, 1176, for the 2-inch, 183 and for the 7 inch, 313 bits per gue per minuto, whik the results obtained with same as were obtained in the British navy Ono 7inch gun holds the remarkable record of 10 26 hits per minute, while the highest score with the 12 inch per minute, which the nignest score with the 12 inch gun firing when the ship was under way in smooth water, was 4 hits per gun per minute obtained on the l'aited States ship "Obio"

CERTAIN ADVANTAGES OF LIGHTD PURL

O judge from a succession of articles which and certainly the most noisy of the London and certainty he used noisy of the fonders daily papers on the use of liquid first in the British navy, one would suppose that the virtues of this fuel had only revently been discovered and the the Admiralty had determined to abolish its coal degots and turn the hunker rooms of its warships into oil tanks. As a matter of fact any such sweeping subsilintion of oil fuel for coal is not now contemplated nor ever will be either in the British or any other 110 VV The natural sources of oil supply are not suffi clent in capacity nor are they so which abstributed as to make it possible eliber for the merchant marine or the natios of the world to make a wholesale sub-stitution of all for coal. Some countries notably the I nited States and Russia possess such abundant sup-plies that they could, if they so wished, make a much more complete use of all, and, because of this adventage it is not unlikely that our nevy at least will nitimetely make a more extensive use of oil fuel than the navy of any other pownr

The advantages of all over coal are so many that were there as much oil in sight as coal the new fuel would in vitebly supersede the old altogether. In the first place, the higher evaporative value of liquid fuel not only enables a larger quantity of fuel to be carried in the same space but its mac randers possible a derrease of 75 per cent in the number of stokers or fire toom witendants. Being in the liquid form it or fire soom altendants. Wring in the liquid form it can be imploved as halland and pumped that be remote quarters of the ship far runwed from the hollier room and insects subfile for the landling and transportation of coal. For the merchant ship this means not only a saving in the fuel and sharp lift, but a possible representation of coal for the merchant ship this means not only a saving in the fuel and sharp lift, but a possible representation for a similar reduction of response and what to fire greater, value, a considerable extension of the cruising radius or the distance over which the ship ran trevel without replonishing her fuel supply. For the merchant ship there is the further advantage that the bunkers can be filled by a pipe line without the or may, airt and underser writen accompany too pres-ent coaling operations, while for the warship there is the strategic advantage that the ship can take on fuel by a pipe line from a tank ship at any place and in any but heavy weather Furthermore, the use of oil enables a whole freet to steam without amitting those tell tale clouds of smoke which are one of the surest means of betraying its presence to the enemy

ANCIENT AND MODERN TRANSACTION

ATRONG sentimental interest will be aroused by the aunouncement that the great irriga-tion works, which at the very dawn of histion works, which at the very dawn of his lor veredored the land of Mesoponamia agarden of fertility, are now being researed on a setuinstive scale under the sames anothers who was responsible for the very successful irrigation works in the valley of the NIN. Our tilluded filtare Commit at Bagada, Turkey, speaking of the importance of these works says that if the plan should succeed of the works says that if the plan should succeed only part. If promises to reveittenine commerce and shift irade balances and traffic in that part of the world. A total of 13 500,000 acress of hand is to be reclaimed at an estimated cost of \$18 per acre, and so fortile is the land when properly brigated, that its estimated value, according to the Terkish government, will \$85 per acre, the soil being capable of yielding large crops of wheat, barley, and cottan. We spoke of sentiment entering into the interest with which we regard this work, and there is con-

tainly something that appeals strongly to the imagi-nation in the fact that both in ancient Expet and in nation in the fact that both in ancient Egypt and in were more anosint Mesopotamia, the Angi-Gazon, after a lapse of four or five thousand years, should be repeating on a larger seals and with the greater akill rendered possible by modern appliances those feats of irrigation which are one of the chief giories of the ancient, but never-to-be-forgotten, races that once foursisted in the valleys of the Nile and the Euphrusse. Wilatever may be the future fait of the great As-

gio-Baxon race, the vast works of irrigation which it has carried out in India and in Egypt and is pow acc twity prosecuting in Mesopotamia, must ever stand out as one of the brightest evidences of its civiling and uplifting activity

and uplifting activity
During the recent progress of President Room-rolt
down the velley of the Nile, his visit to the great
reservoir at Assonan and the sight of the marvelous
ferrillity with which it has enriched the valley
blow, must have carried his thought to those even
greater works of irrigation which are now being
preserved in the arid region of our Western States; works which owe their inception largely to his own tireless energy and enthusiasm. Here also the latest and most powerful branch of the great Anglo-Saxon rare, in the space of a few years, has completed the initial work for a project which promises to bring thirty million acres of unproductive land under the richest cultivation. And in this connection it is limely to draw attention to the great ability with which the Reclamation Service has done and is now carrying on its work. A well-deserved tribute to the engineers in charge was recently made by Senator entiners in charge was recently made by Senator Newland of Newland and Newland with rare speed,

The work siready accomplished consists in the provision of dams headworks, etc. and the \$30,000. water so stored, by the construction of canals for dis-tributing the supply upon the millions of acres which only await lis arrival to spring into instant fertility

TESTS OF TUROSTEN LAWFS

a buildin recently issued by the University of results of an important study of various types of tungsten and imandescent lamps a study which should prove of considerable interest in growing importance of metallic figment illumination The conclusions of their investigation may be thus

Comparisons of the durability of fliaments made by Comparisons of the cursourty or manners mave by the colloid, deposition, and pasts processes are very difficult to make because the three types are usually mounted differently Undoubtedly the manner of mounting the filament has a great effect upon its like, and whether the superior life of one type lamp is due to the fact that it has a better scheme of mounting or to the fact that the process of manufacturing is bet-ter, can hardly be decided definitely from these tests. ter, can hardly be decided dennicity from these begs. Tests of filaments made by the three processes and mounted in exactly the same way would be necessary to decide the question definitely From the tests de-scribed, however, the colloid process seems to give a filament that is less durable than the other two. The diament that is less durable than the other two. The class show that performances of tungates lamps vary to a surprising degree, depending upon the kind of lamps used and upon the conditions under which thay are burned. Some lamps will give as high an operating cost as the old carbon lamps while burning under certain conditions, whereas other jumps will give good entered the conditions, whereas other jumps will give any other conditions, whereas other jumps will give any other conditions. Under the best consistent give acceptance of the first performance of the first state of the condition of t ed in a remarkable way and the life is very long, often several times what the advertised life is. Breakages in shipment and handling have been reduced to a small fraction of what was formerly comduced to a small fraction of what was formerly com-mon Of, three hundred lamps purchased for the tests by the experimenters, only three were received with broken filaments; and although the lamps in some of the tests were handled doesn of these, almost no trouble was experienced so far as the breakage of file-ments was concerned.

Scientific American

ENGINEERING.

The Minister of Public Works of Panama will shortly sak for bids for the construction of a railroad from Panama to David, a distance of 300 miles. Bids will be saked also for lines from David to Booss del Tore, and from Panama to Los Santos.

The Mary Department recommends an appropriation of \$10,000 for prises, etc., to be awarded ships in commission for general efficiency and economy in coal consumption it is estimated by the Department that competitions of this character have resulted, and will continue to result, in a saving of ten per cent in coal consumption.

In spite of the steady increase in passenger travel in this city, the opening of the new East River bridges to beginning to tell heavily upon the traffic over the East River ferries. The Union Ferry Company of Brooklyn has been oblighed to discharge three boat craws, and change the schedulo on three different lines from a 10-minute to a 50-minute headway.

Acting on the recommendation of the Public Service Commission, the interborously Company of the city will install care with destination signs on the elevated line, which will automatically tell the elevated line, which will automatically tell the control of the station the train is approaching. The great convaniance of this arrangement to the travel public will be out of all proportion to the small cost of nutting it in place.

THE "VIEING"-SELF-DUMPING DECK SOOW.

A novel system of self-dumping seow capecially designed for the discharge of rock and solid debris bas signed for the discnarge of rice and some action of the born devined by Mr. A. F. Viking sustince and ship-builder of Stockholm. At this port the committed dumping of such material into the water is of part tholar interest hassmuch as the blasting of rock in

contilbrium of the latter is upset merely by & equilibrium of the latter is upper mercey or formules water through the agency of compressed air into the elevated tank, which causes the scow to till over and shoot its lead Bhould the flush deck be fitted with the white arks, these are fashioned in the form of bot tom hinged doors on the discharging side, so that they wn as the barge heels over, and permit the load

After damping, the seew returns to an even keel.

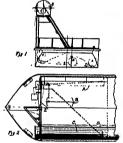

connection with the extensions to the harbor or the streets of the city is in continuous progress Several designs for automatic dumping have been evolved but the Viking" system so called after its designer, has been the first to be submitted to practical test and has proved remarkably successful. Through the courtesy proved remarkably successful. Through the courtesy of the inventor we are enabled to illustrate and de-scribe this new barge, it differs in its action from any

in the hold of the seew on the side opposite the elevated cylindrical tank is carried another tubular tank A about haif the length of the former. This is filled with water, and in the case of the scow illustrated holds about six tons for a load of 200 tons on trated holds about six tons for a load or zow one or the deek. Alongside this water tank is a small cylin dri ni vessel B containing compressed air the pressure being approximately seven atmospheres. On the same side as the elevated tank in the hold below, is a third cylinder C also about half the longth of the clevated compressed-air vessel is also connected to this valve box, but is shut off from the same until ready for dumping. The third vessel below the elevated cylinder, as siready mentioned, is always open to the free atm as already mentioned, is always open to the free hims-sphere through a pips, but there is a second pipe and valve provided in connection with the main communi-cating pipe between the first water tank and the ele-vated crimder. It will thus be seen that there is valed cylinder it will thus be seen that there is always open communication between the first water tank and the elevated cylinder by means of a main pipe which is carried up alongside the vertical leg of the tripod at one end In addition there is a smaller the tripod at one end In addition there is a smaller air pipe running up one of the triangular legs and passing right into the body of the tank, having its outlet near the top of the cylinder inside. This pipe is in connection with the outer atmosphere, so that nor-

in connection with the outer atmosphere, so that nor-mally the upper yeasel fail till of air.

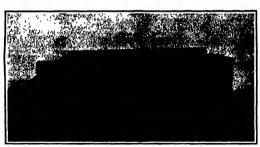

The load is stowed on deck in the manner abown in the illustration. When rock is handed, bulwarks on three sides only are necessary, the fourth side from which dumping is effected, below the elevated man, being ist quite open or at the most having only a low ridge. It soft material is carried, hinged doors, as already described, may be used, those automatically opening under the pressure from the food on deck when failing flat and clear so as not to obstruct the shock When the loaded bargs has been towed to the dumping site, a cord is putted connecting the mechanism of the scow with the tug. This opens a vairs, wich

ing sits, a cord is putted connecting the mechanism or the scow with the tug This opens a valve, which permits the compressed air to flow to the valve box, and also a slide valve in the latter, whereby the com-pressed air is admitted into the lower water vessel A. The pressure exerted forces the water from the lower tank into the elevated cylinder D, the displaced air is the the development of the control of the contro

A, B, C D are ballest tanks by the emptying and filling of which the second dumped and righted Fud elevation and half-deck plan of scow.

other vessels of this class in service inasu stead of the coutents being dumped through self-open ing doors in the bottom of the hull the se over on lis beam ends by a very simple action. The load is carried on a flish deck or the fatter is fitted with low butwarks. On one side, extending the full length of the seew is an elevated cylindrical tank D, mounted about 16 feet above the level of the sleek on two tripods. When it is desired to dump the barge, the

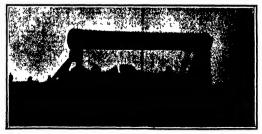

The scow titted and load sliding into the water

cylinder which at first is empty, but which is always

open to the outer stmosphere through a small pipe. The water vessel A in the body of the pontoon is in open communication by means of a pipe E with the elevated tank, and the former is also in connection by another pipe with a valve box pisced at the foot of the tripod carrying the upper tank. When the valve in this box is in its initial position, this second com-municating pipe is open to the free atmosphere. The valve box is returned to its normal position, cutting off the supply of compressed air to the lower water tank, and at the same time opening the latter to the

free air
The load may slip off the deck at varying inclinations, this factor depending on the friction between the load and the deck and the character of the débris II he slipping takes place early, at a low deck incitionation, the upper cylinder may never reach the water, for the scow rights itself immediately the load all dicharged. Should such result, the water forced into the elevated tank returns to the lower water tank dipsetly the compressed-air supply to the latter is cut off by the second poil of the cord controlling the mechanism. It may happen, however, that the scow heads right own. It is the second poil of the conference on which at once oness the communication. it back to the spright position a third pull is given to the contrict lops, which at once opens the communica-tion between the upper tank D and the water ressel O placed immediately below it in the hold. As this latter tank is always placed in a position lower than the cleavated cylloder, the water must flow by gravitation into it. When a sufficient questity of water has passed from the upper to the lower cylinder, the harps rights itself, and the water remaining in the elevated tank as well as that in the tank immediately below, returns as well as that in the tank immediately below, returns as well as that in the tank immediately below, returns to the main water cylinder on the opposite side of the vessel in the held, by gravitation. This accomplished, a fourth puil on the control cord returns all parts to their original positions. The compressed air is the into its vessel by means of a hose complet on a return in the top of the air chest, and when sufficiently charged the valve is closed and the hose removes. When the barge is to mis springly position, all values? We

Lended and ready for dumning. THE "VIETE "-A SELECTIVE MADE 1904.

Scientific American

the elevated that, or the one immediately below it, must return to the first tank on the opposite side of the barge, as the latter is placed at the lowest point, the return being purely gravitational it will also been that the water circulating between the tanks cannot escape. Giverine is mired with the water to revenity revening it could weather, so that the system revenit freezing in could weather, so that the system can be used any time of the year irrespective of cli-

The scow shown in the accompanying illustrations is in daily service at Stockholm, and has proved emisently satisfactory to the engineers of the city. The results that have been obtained prove that this self The dumping barge is superior to the ordinary hopper type with false bottoms. It is cheaper in first cost and maintenance, can handle rock of practically any size and weight within its total capacity, and is a first class cruft for any harbor transport. If desired, the calm craft for any harbor transport. If desired, the elevated cylinder can be unshipped in a couple of hours and the barge used as an ordinary lighter. The system is applicable to any type of barge whether of the blunt-ended type or one of fine lines. It is only necessary to insure a sufficient breadth to counteract the influence from high winds. The success of the flush-deck type has induced the inventor to extend the idea to craft with sunken holds for bandling gravel, mud, and other semi flouid or soft material, which canot be accommodated on a flush deck.

WALLEY'S COWET AT ITS BRIGHTEST

BY REMET ROBERS RUSSELL, TR D., PROPERTY

It may have seemed remarkable to many people that so long a time bas clapsed since the first observation of Halley's comet at its present return, and yet it has not shown itself at all to ordinary eyes. The accom not snown town; at all to orthusty eyes, the account panying illustration (Fig 1) will help to explain this. When first detected has September with very powerful telescopic aid it was far beyond the limits of our diagram, at twice the distance of Mars from the sun, and nearly as remote from the earth. At first the two

Fig 4 Spectrum of Hatley's comet

raphed at the Yorkes Observatory by Prof. Frost, January Lith The spectrum of the counct le in the middle between the two ghiest star-spectra. Nee description in test. The blue end of the spectrum is on the right, the situ-violed on the left.

bodies approached each other rapidly, but before the end of the year our planet crossed the line joining the comet with the sun, and by January 1st, as the figure shows, we were moving simost straight away from it shows, we were moving amous straight away from it.

During the early part of the year the earth and comet
passed on opposite sides of the sun, so that it was
lost to our view early in March
About the time that this is printed it will come into

About the time that this is printed it will rome into agict again, on the other side of the aur rising before daybreak. But now its path has corred so that it is coming toward use—dimed interctly, if we take it or motion into account as well as its own it therefore seems to stand atmost still among the stars, while growing steadily larger and brighter, so that any one might cell by its mere changes in appearance that it was approaching us rapidly
Finally, about the middle of May the comet

apparently approach the sun again, and on the 18th It will pass in front of him, literally between us and the aun, transiting the latter's disk If at this time its is more than fifteen million miles in length we will name through it, as the figure shows."

The cetnet's closest approach to us comes two days later, on May 20th, when it is but fourteen milition miles away For a few days following this it will be didly visible in the evaning sky, and then it will fade gradually as it recedes from us.

rate gradually as it recedes from us.

It is clear from the diagram that this apparition of
the comet is an exceptionally favorable one, for it
passes the earth almost at the point where their orbits
come nearest to one another if it had returned only three weeks earlier, it would have come as near as nearths possible—only seven millions of miles—but at this time it would have been directly south of the earth, astro * Prof. Barnard has informed as that the tall was 14,000,0 hag on Polymary Sith, from which it may well be informed t

nomically speaking, almost over our south pole, and quite invisible from northern latitudes. It therefore appears that the present conditions are simost ideally favorable for observers placed as we are, north of the

The illustration on the first page above better than any vorbal description where to look for the comet in the morning sky in New York The moon and Venus

are shown in the positions which they will occupy about May 1st, when, on the whole, the comet can be seen to the best advantage At an earlier date, Venus seen to the best avantage. At an earlier date, venue was higher in the sky, compared with the comet. There was less trouble then from moonlight, but the comet did not rise so early—about 4 A M on April 15th as against 3 A M, on the later date

against 3 A M, on the later until The comet's brightness when it appears in the even

Observatory show the appearance and character of the comet earlier in its apparition. Fig. 2 lilustrates its extreme faintness at the time of its rediscovery (which was announced by Prof Woif of Held there less than a work before the earliest of the four photoless than a wook before the earliest of the four indo-graphs here shown was taken) while it was still 400 million miles distant, both from the earth and from the sun. On any one plate it is difficult, if not im-possible to distinguish the comet from the multitude of faint stars around it, but on comparing the four (which show exactly the same region of the sky) it

twhich show exactly the samo region of the sky) it is easy to see that the stars are the same in all, while the comot is 'here to-day and gone to-morrow". With the great Yerkes telescope (which gives far smaller and sharper images of the stars than can be reproduced on any known photographic plate) the comet was evon at this time quite different from the darks in apparamace, in Prof. Baranard's words, "a fleck light sorrounded by a faint nebulosity" with no

egraphs taken by Mr Lee with the two-foot reflector of the bearratory. These four photographs represent the same af the sky. The errows point to the count which appears. His a finish size but moves from night to night.

definite boundary His measures, made on several nights, show that its actual diameter was about 12,500

Our second illustration, from a photograph taken when the comet was 143 million miles from the sun, and 163 million from us, shows it already well ad vanced in the changes which invariably accompany the approach of any considerable comet to its perthelion.

The head of the comet has become larger—not merely in apparent size, owing to its approach to os but actually in miles, while a faint slender tail, pointed

way from the sun, makes its appearance
As Fig. 1 shows, the tail, which extends directly away from the sun, was at this time also nearly in line behind the head as seen from the earth so that its actual length must have been much greater than -about five million miles, according to Prof Barnard

This considerable development of the tail, while the et was still at two and one-half times its least distance from the sun, makes it probable that at and after the perihellon passage, on April 20th it will be much longer, probably long enough to envelop the earth as it sweeps past.

Our third illustration shows the spectrum of the comet photographed on January 14th, when it was short 170 millon miles from the sun

In taking such a photograph, a prism is placed in front of the camera. The light of a star is thus drawn out into a line which, by jetting it trail on the plate is hroadened into a band, crossed by the dark lines which tell us what absorbing gases exist in the star's atmos-phere Most of the objects on the plate are the spectra of stars near the comet obtained in this way spectra of stars near the comet obtained in this way The comet's spectrum is near the middle between the which were produced by supplementary exposures of some bright star, and serve as reference marks to find the position of the lines in the spectrum of the comet itself. The inter unlike that of the stars consists

Fig. 8.-Halley's comet on February Sci. 1910.

From a photograph taken at the Yerkus Observatory by Frof B
As the instrument was kept pointed at the coned during the cap
the stars appear as short streaks. The actual length of it
comes a tall is about fire million mile.

mainly of bright bands or flues three of which are conspicuous. The brightest of these as is shown by comparison with the hydrogen lines of the comp spectrum is the so-called cyanogen band at the ex-treme violet end of the visual spectrum. The others are probably as in the case of other comets, also due unds of carbo

to gaseous compounts or carbon.

Between these bright bands can be seen a faint continuous spectrum, due to reflected sunlight.

When the comet first appeared the photographs made at the Lik Observatory showed this continuous spectrum alone. At that time it must have been shining cutirely by reflected light, but by the date of our lilistration it had already begun to be self lumi nous. This is corroborated by the fact that its hright creased much more rapidly than could be ex ness increased much more rapidly than could be ex-plained by the mere increase in the amount of reflected light, due to its approach to the sun and to us. This intrinsic light of the comet, as its spectrum shows, is given off by iuminous gas, but we do not

yet know what makes this gas shine. It can hardly be high temperature, for the comet had just come from the depths of interplanetary space, and did not yet receive nearly as much heat from the sun as the earth does. It must however, be due to some kind of solar does. It must noweer, or due to some kind of soins artion, for it increases very rapidly as a comet approaches the nun We can reproduce the same spectrum in the ishoratory by passing an electrical discharge through a vacuum tube containing compounds

of carbon and nitrogen at very low pressure it is of special interest that, even if the carix compounds form but a small percentage of the gas in the tube, their spectrum becomes relatively prowhen the pressure is made very small say 1/100 000 of that of ordinary air It may be, therefore, that at the lowest presences carbon compounds have an ex-ceptional calacity for shining, and it would be unsafe to conclude that they are the principal gaseous constituents of the comet, because they give off almost all the light

It may be added that the cynnogen bands in the spectrum nie producel net only by the polyonous gas of that mane but in all cases who excises and ultrelogether under chairbal excitement. For ex gen are logether under cleirial extlement. For example, they are very strong in the spectrum of an ordinary are light where the ultragen comes from the are and the carbon from the terminals. It would be out as prasmable to conclude that me are light was polemons after looking at it through a spectre from a distance, as he make the same deduction ab

Whatever may be the origin of this intrinsic light of omets it is responsible for most of the phenomena while make item of general interest for aimost all the light of the tall as well as of the head of a bright comet is of this kind. If Halleys comet shows by reflected anniight alone it would be barely visible to the noked eye, even under the most favorable circum.

Actually owing to its intrinsic light it has been a considerable object at every return for the last 2,000 years. The only gape in the record—in A. D. 912—has lately been filled by the discovery of nomistakable

references in old Inpunese chronicles.

The principal quantity of matter composing it must The retual quantity of mutter composing it must however be very small as compared with the more famility heavenly bodies at he possible to form a rough guess as to its amount by considering the amount of light which it relieves when it is not shiring on its own account. From the estimates of magnitude made last Soutember, it appears that a single body made last Siltenber, it appears that a single odey only a little over 30 miles in diameter at the distance of the comet would have sent us as much reflected light provided that its reflecting power was equi-tion of the mean, which is lower than that of most of the planets

It is, therefore clear that the comet must b posed of separate particles widely separated. The eter) is about 120 million square miles, while the ever) is about 120 inition square nities, while the total area of all the reflecting particle, according to the above estimate is about 1000 square miles. A ray of sunlight falling on it has therefore less than one chance in 100,000 of being stopped, and all the rest of chance in 100,000 of bling stopped, and all the rest of petiting throats some enuty space. It is no worder that commis are immaparent, and that stars san been through them; if we only knew how big these particles were, we could now estimate their number and their total name. But here we are quite in the dark. As the light of the comes seems uniformly diffused and it shows no signs of resolution into points of light, the number of particles composing it must least be coursed by insusant. Their average diameters of the composition of the com

But low much smaller than this limit their actual dimensions may be we do not know if, purely for illustration, we suppose that they average an inch seroes, there would be some five or als millions millions their This success like an enormous number, but we calculate the lank of the comet we find that there would be only five or six parities per cubic mile of space on the average loside it. Near the mile of space on the average lostde it. Near the center they would deduties be more closely packed, center liey would deadties be more closely packed, and more thinly toward the outer paris of the comet. The combined bulk of nit these particles would be about 80 million cubic yards a large amount from the engine ring similation but not equal to the quantity of water which falls within the limits of the smallest State in the l'nion during a heavy rainstorm

This may serve to give us some idea of the extreme the comet as a whole if we took a sp as big as the comel, that is, half as much again in diameter as the earth, and sowed ordinary golf balls through it at the rais of two or three per cubic mile, leaving the intervening space absolutely vacant would get something that would look quite as bris as Halley's comet - if out alongside it when it first

The gaseous matter width gives most of the light at perihelion probably comes out of the solid particles as these grow warm under the sun's heat when they approach it As the gas becomes luminous under solar action, the brightness of the comot increases and its regions originally invisible because the number of reflecting particles was too small to influence our

eyes, gradually come into view

Some of this is repelled from the head of the co by little known forces, and driven away from the sun by the action of the sunlight which, as is well known, exerts a force of reputation which, if a particle is ex-ceedingly small as are the gaseous molecules, is stronger than the airraction of the sun

stronger than the altraction of the sun Thus arises the long and magnificant tail which, like the smoke-trail of a steamer at sea is ever being renewed at one end and fading away at the other, swen though it seems to accompany the comet'in its journey

As the comet recodes from the sinn, much of this are outs matter has thus been lost, never to be regulared. Some of the remainder probably condenses tound the solid particles when they become cold, and

one co-apes into space

The comet is thus gradually losing its se and in the course of ages it may be deprived of all its tall forming material, and lose its former glory This seems to have actually happened to some of the short period comets, one at least of which has disappeared altonath. n

allogethr
Halloy a comat is perhaps preserved from such a
fate by the longer interval between its returns to the
region near the sun, where its activity takes place it
may be too, that it has more of the right sort of material to spare for a tail. But the time may come terial to spare for a tail when the time may come when most of this is lost, and its successive appearances may gradually lose those impressive features which have so long inspired awe and wonder in the hearts of mankind, and dwindle at last into something which the professional astronomer alone will be in

The Mercury Vapor Lamp and Sta Effect on the Rye. About a year ago we published a reference to a report of Prof J Norman Collie, FRS, stating in effect that a German medical journal had described certain cases of alleged injury inflicted upon the eyes by rays of mercury vapor lamps These cases referred certain cases of alleged infary inflicted upon the eyes by rays of mercury vapor lamps. These cases referred to all prove to have resulted not from the meccury vapor liminshing faum, which is now so largely in use in this country and which is constructed with a tube or container of glass, but from a special lamp used in medical, storillation, and chemical processes, bearing a quarte container. The medical or settliting lamp, to be sure, uses mercury vapor, but its container being of quartx, it is transparent to those rays which being of quarts, it is transparent to those two a winter may be injurious to the syes, while glass is opeque to such rays and does not permit their passage. The quartz lamps reforred to by Prof. Coilis are intertionally made to emit germ-destroying ravs Dr Charles P Stolnmetz who has made a careful study Charins 1º Mulinivez who has made a careful study of mercury vapor lamps used for illuminating pur poses, stated in an article in the Electrical World and Engineer of February 21st, 1901, as follows "The micrury are therefore is the only known arti

ficial illuminant which is perfectly harmless and thus especially suited for use where accurate work has to be done by artificial illumination, as in drawing rooms, offices, factories, etc

The same scientist in an article in the Daily Union, Schenestady N Y, on January 17th, 1903, stated as

Therefore electric ilghts are less harmful than gas or oil lamps, being whiter, and the white daylight the least harmful while the mercury are light which is entirely devoid of red rays, is absolutely harmless, and a person can look straight into one of these merhe it

In one of Dr Steinmetzs books entitled "Radiation, Light, and illumination" he makes the following

The harmful effect of working very much under artificial illumination is largely due to its energy effect, incident to a large amount of orange, red, and espe-cially ultra red in the radiation of incandescent bodies used for illuminants and thus does not exist with 'cold light, as the light of the mercury lamp"

The Current Suppley

Prof R F Ruitan writes most interestingly in current Bupplement No 1789 on the manufacture of alcohol from sawdust and other wood waste. A novel type of automatic stamp-wending machine is described and illustrated Prof Charles Edward Lucko writes and Illustrated Prof. Charles Edward Lucke writes on the development of power systems. Prof Otto N Witts paper on fast and fugitive dyes is concluded Itarian I Smith precents some curious information on the wooden monuments of the Northwest Coast Iradians A highership of the famous Dmitri Vascovitsch Mondeloff is published A method of Instantaneous microphotography is described.

The Highest Dam

At the hour of two in the morning of Sunday, Jane-ary 16th, the completion of the Shoshone dam in Wyon-ing was announced. This is the highest dam in the i, being 338 4 feet from the base to the parapet. worth, being 3500 feet from the base to the paragher. It is located in the profound canyon of the Shoshons River, in one of the wildest and most picturesque regions of northern Wyoming. The walls of the gorge are nearly people did not the proposition of the pr the stream At its base the dam is 70 feet across: on top it is 175 feet in length, and at the base the dam is 108 feet wide

The completion of this dam creates an enreservoir, having a surface area of ten square miles and an average depth of seventy fest. The capacity and an average depth of seventy feet. The capacity of this irrigation beats in galloss is something like 148,588,512,000. The construction of this great dam was attended with difficulty from the beginning, owing parity to the inacressible section in which it stands. The dam is to control for all time the great shoot of the Shoatone River and to provide an ample water supply for the irrigation of more than 100,000 acres of

exceptionally fertile land in the valley below, a portion of which is now available for settlers under the terms of the reclamstion act.

The contract for the Shoshone dam was let Septem ber 18th, 1905, to a Chicago firm for \$515,730 This firm, however defaulted, and the work was completed by another contractor

Hall-Cleaning Car,

When streets are chaned by aweep When streets are cleaned by sweepers, whose brushes push the dirt before them, the dirt is sweet Into the grooves of the street railrend rails and than compacted by the wheels of the running ears. The rails account with dirt offer a greater resistance to the electric current, harshy causing a greater amount of power to be used for the propelling of the cars. The rails must be constantly cleaned to avoid ions of current.

The Hanover Street Railway Company has built for this purpose a special rail-cleaning car It is similar astruction to a regular two-axis car, and has two 25-horse-power motors Between the front and rear wheels on both sides of the car are steel brushes, which wheels on both sides of the car are steel invalue, which locean the dirt from the rails This dirt is automatically removed by a vacuum pump, and deposited in a box built into the lower part of the car between the nates of the driving whoels The vacuum pump is easier of the driving whoels The vacuum pump is operated by an electric molor staked to the dirt box. To avoid the raising of dast in dry weather, a sprink are and two lands, bolding about 252 gallous of water har and two lands, bolding about 252 gallous of water. each, are provided

As soon as the box is filled, an automatic elerm notice

As soon as the bot is filled, an automatic slarm notifies the motorman who shits off the pump, raises the humanes, and takes the ear to a place where it can be emptied and made ready for another trip. This car can be run at any rate of speed allowable in sirvet trainic, up to 17% subles per hour, and still will work with good results. It can be run by one and and the amount of power used at a speed of 10 miles per hour, and still will work with good results. It can be run by one and and the amount of power used at a speed of 10 miles per hour is only about 3,000 vote per miles. The car can itsen daily an exercise of 45 miles of these will be a second to the second t of dirt per mile of track

WANTED-A RICE MULLING MACRIME

To the Editor of the ECHENTIFIC AMERICAN
Whoever will invent a machine to hull rice, will be
as great a benefactor to the rice farmer and the conas Eli Whitney in the invention of the cott gin. The farmer often gets 75 cents per hundred or tess for bis raw product, and generally has his crop in the mill for months before he gets (his The mills are the militar months because of the necessity for large storage, but the real mili part of the viant is about the same in machinery as a flour mili. The main processes are two, the removal of the hull and the noval of the polish The former is accomplished by removal of the polish The former is accomplished by burr stones, but the grain passing from under these is not completely clear of the hull. The next process is accomplished by a cylinder of wire cloth containing a revolving core of absopatin with the wool on, which takes off the remaining hull and the outside of the grain as well. The native French of Louisians pregrain as well The native Frence of Louisians pre-pare their rice by means of a scoden peetle, which removes the bnlis and leaves the polish, the most nutritious part of the grain Usually the mills have an arrangement for coating each grain with parafin, but this is not even an improvement except in ap-

Whoever will invent a small machine, say in size similar to a farmer's fan mili, that will remove the buil from the grain, will remove the rice crop from the enormous toll now paid the miller, and give a cheap and healthy food to the people as a superior substitute for the present rapidly ascending foodstuffs to which we have been accustomed. There are large investments in the million of the crop but it ought to be a paying investment with \$9.75 profit between the planter and the consumer on each 75 cents received by the farm C. W CAMPBELL Johnston City, 111

THE EFFECT OF REFRACTION ON THE TRIANGULATION OF MOUNTAIN SUMMITS

A REPLY TO MISS PRUK'S STATEMENTS IN THE PRESS

To the Editor of the SCIENTIFIC AMERICAN To the Editor of the SINETHICA AMERICAN Blace the anononcement by Mrs. F. Bullock Work man of the results of the recent releasifies and carefully accepted measurement of the two summits of Moint Hansarana by the professional engineers and out to Peru by her from Paris, Miss. A Peck has accorded to press with communications, the wident purpose of which is to believe up her assertions not based on any which is to boister up her assertions not massed on any measurement data as to the height of that mountain by attempting to discredit the figures obtained by triangulation the most accurate method of measuring stittude known. To effect this the communications contain a quotation and two statements, one of the seurd and self-contradictory in its to brought together as to tend to befor the mind of the brought together as to tend to being the mind of tra-reader and lead him to infer that in general the re-sults of triangulation of a mountain summit by an expert engineer are likely to be vitiated to an extent of 4,000 feet by refraction

of 4,000 feet by rofraction
The quotation from Mr Mumm and the statement
attributed to Dr Collie, the one a publisher and the
other a chemiet by profession, neither of whom, so far
as I know, has ever claimed to be an expert in attitude measurements, merely repeat in general terms what is well known to engineers that no method of determining the exect amount of refraction having been vet ing the exact amount of refraction naving oven discovered, the present bolgsts of certain high mountains obtained by triangulation may be somewhat changed, either higher or lower, should such method be discovered in the future. Such change would probably not be great in any case, and in many acoust acould be very slight, varying from mothing to a few would be very slight, varying from nothing to a few feet, for no coefficient of refraction that is likely to be

used would greatly alier the results now obtained

Between the recognition of the fact that figures
obtained by triangulation may not now be absolutely, though they are essentially, accurate, and lous statement asserted by Miss, Peck to have been made by a nameless friend of a so-called 'former member of the British Royal Engineers' that he triangu our or the British Royal Engineers' that he triangu-lated the great peak K-5 and obtained a beight 4,000 fest greater than that now assigned to it by the Indian Survey, which impossible difference Miss Peck would have the public believe is due to refraction, there is

nave the pulse person is the description of an absolutely accurate method of determining refraction would affect chiefly the present altitudes assigned to certain very high dayan peaks, such as Mount Everest, which were triangulated from very distant points low down in th Indian plain, and to a less degree some other high phalis also measured from distant stations. At the layan surveying, speaking of the very highest moun-tains said "Wa do not know exactly, and at present there is no means of determining, what the exact effect

there is no means of determining, what the exact effect or ferfraction may be in those sittudes, and the result of variation when applied as correction to those observed tripomentrical sittudes may be considerable. To show what he judges to be considerable may be added his further remark. "Mount Everest will probably prove to be some hundred feet or so higher than we at present revion it."

Observe that file Thomas considers one hundred feet in 29,003 the present height assign Everest, a considerable change in the sittude of that peak which is the most extreme case of all on account of its great sittude, its distance from the measuring of its great altitude, its distance from the measuring attainers, and the large amount of moleture in the air above the hot, steamy piain of Beogal He does not for a moment embertain the flayer of 4 to 60 feet and to be auggested by the frie hof of the British Royal Rogi neer If Bir Thomas's estimate be a probable one in this case, in the more favorable ones of lower summits measured from near stations the amount of

correction would shade down nearly or quito to zero

Now Miss Peck supposes an allowance similar to the
friend of the Royal Engineer's 4,000 feet made to the ascertained height of Huascaran and asserts, "It migh easily happen that the mountain is one or two thou easily happen that the mountain is one or two thou and feet higher than it has been figured," which would bring it up well toward the attitude she has estimated it at. Such a supposition is not tenable Even if the 4000 foot statement regarding K2 were true the conditions in this case are entirely different Her plan is ingenious but not creditable to her knowl edge of the principles of attitude-measurement Sup-positions have no plate in this field. Observed facts are what count.

M do Lasminst and his assistants who are expert engineers and know what they are about triangulated the two summits of Hussearan from four accurately red stations at an aititude of 12500 feet, i immediate neighborhood of that mountain in perfectly ticar weather. Here was no immensa distance, no haze in the air no great height of the aummits above hase in the air no great height of the aummits above his stations, as in the case of the great Himalayan peaks mentioned, to cause any appreciable chance of error due to refraction. Refraction in this case, if not allowed for at all would be practically a negligible quantity. His results determined from four stations being usually considered sufficient to insure accu racy, must be exact to within a very small figure. Prof. Fr Schrader and M Henri Vallot of Paris after careful personal examination and checking of all careful personal oxamination and clueking of all M do Larminate observations and calculations have indorsed them as correct. The indorsement of eugineers of such worldwide reputation as they have is a sufficient guarantee of the accuracy of the work. Miss Peck may therefore rest assured that this triangulation cepted by engineers and experts as arenra and definitely settling the question of the attitude of

and definitely settling the question or the attitude of the two summits of Husscaran Miss Peck makes two other statements, the relation of which to the attitude of Husscaran is not apparent (1) That I "Improperty claimed" a world record with (1) hat 1 improperly calimine a worst recurs with 23 394 feet, and (2) that Mr Graham's ascent of 'Monnt Kabru, about 24,000 feet, twenty years carler, is now quite generally acknowledged " Mr Graham on bis return from the Eastern Illimalaya claimed to on our return from the Eastern Illimalaya claimed to have nearly ascended Mount Kahru as well as to have made a number of other high ascents. He gave an account of his experiences, in London His claims were very generally disbelieved at the time and atterward ers and engineers, and were especially by montaineers and engineers, and were especially disputed by the Indian Survey, the members of which were in a particularly advantageous position to judge of their truth. The grounds for discrediting his secent of their truth. The grounds for discrediting his second of Kabiu were serveral but the strongast of all, well known to the Strong ordination as some children to the serveral truth the strong of the second to the strong ordination and the second truth to the second truth truth truth the second truth tr

Some time after the event Mr Douglass Freshfield advocated Mr Graham's claim bringing forward no new evidence beyond Mr Graham's original account. new evidence beyond Mr Grann's criginal account, but busing his opinion on certain considerations of probability, which though specious were not con-clusive and did not convince the public He stood nearly alone for years Recently a few of his friends have expressed their concurrence in his opinion, and in the United States Mr E S Balch and Miss Peck have echoed the cry, though natiber of them can have any knowledge of the question that can make their ding it of any value. The world at large as remained either neutral or disbelieving.

It is noteworthy that Mr Graham had no .nstru

It is noteworthy that Mr (Finantin has no instru-ments, not even an ancroid, with bim by which to determine the allitudes he claimed to have reached so that, as in Miss Peck's case his ideas as to his altitides were bised wholly on guesswork. It is also

significant, as an English journal recently stated, that after his account given in London, he never joined in tha discussion that followed nor attempted by any further statement to defound his claim Not long afterward he disappeared, and, so far as i bave bed to learn, his whereabouts have slote remain

Mr Graham's account constitutes the only evidence available in the question if anyons after reading this chooses to believe that his claim to have ascended Kabru is valid, he has a perfect right to do so, but such belief does not afford any proof of validity, nor does it warrant the person holding it in asserting that Mr Graham's ascent is now quite generally acknowledged. The only verdict that can be reached, as the

matter stands is that of unproven in stating the above facts I wish it distinctly under atood that i am nol expressing my own opinion as to Mr Graham's claim This i have nowhere done either in lectures or in writing although such expression has been ascribed to me by others
With regard to Miss Pecks repeated as

i 'improperly claimed' a world record with 23 394 feet, I improperly claimed a world record with 23 394 feet, my position may be stated as follows — Although, as a matter of fact, this attitude sitsined by me in 1983, was and remained for several years the highest measured altitude reached on an ascent, and although I had ured artitude reached on an ascent, and although I had every right to publish I to the world as a record, with two exceptions I have never mentioned it as such either in public or in print not even in the volume 'tee Bound Heighls of the Musiagh,' by Mrs Bullock Workman and myself in which i have described my ascent to that alllinds One exception was a mention of it in one of the issues of Whos Who? The other was in connection with a paper on that ascent read before the Alpino Club in London in May, 1905 when

'The word record' in the title of this paper is us as referring to the highest substantiated ascent yet made in mountaineering. The contention that Mr Grabam reached an attitude of 24,000 feet has on various grounds whether rightly or wrongly been so strongly disputed that it must be regarded as far from proved and therefore the stitude mentioned car properly cloin a place among those acknowledged to have been made

in this year 1910, so far as Mr Graham's claim is concerned I was no rement to alter a word of that

in view of the above I do not think it would be in view of the above I do not think it would be contrains in m. to deprive Miss Prek of the distinc-tion of 'improperty claiming' is world record to which she herself has enjoyed a monopoly for the last two years. During that time her chief appeal to the in terest of the public has been not by scientific observa-tions on natural phonomena at high altitudes but by constant referation in the press without the authority of any measurement proof of claims to the attainment of an attlinde variously stated at from 25 900 to 23,000 feet which finally crystallized into 'it may be re-garded as certain that Huasemenn is above 23 000 fost if, as seems probable the height is 24,000 feet i have the honor of breaking the world's record for men

as well us women

Mrs Bullock Workmans engineers have now stripped her claim of all its and probabilities and brought it definitely down to 21 812 feet the attitude of the lower summit of Huascaran she claims to have WILLIAM ILL STER WORKMAN ascended

Effect of Bainfall on the Cetten Industry.
The amount of salofall and the development of the cetten industry in any region are intimately connected. The first proof of this rather surprising assertion is found in the continual codewor of inventors to devise means of giving to the air of cutton spinning as a proper and sufficient degree of humidity. But a deficiency of natoral humidity cannot be perfectly remedied by artificial means, and it is a fact well known to all cotton spinners that the proapindies is considerably increased by the constant prosence of a large amount of moisture in the air The moist climate of Normandy has made that prov ince the chief sent of the cotton industry in France a similar reason Manchester has been center of the English cotton magnifucture. In addition center of the English cotton maoufacture. In addition to a moint atmosphere the cotton indostry requires abundance of water in its visible form. Cotton mills are always located un or near wireams and are pro-vided with capacious reservoirs.

Hence the great diminution in the rainfall of the fanchester district which has taken place within the last half ceniury is a valid cause for alarm Heakeil collated the records of rainfall made between 1880 i 1908 He finds that the mean annual rainfall and 1908 was 36 inches between 1860 and 1886 but only 27 1-3 inches between 1886 and 1908. The observed shifting of one of the branches of the Guif Stream is suggested as a possible cause of this great decrease in relatati which threatens the industrial prosperity of Maoches ter and the surrounding district -Cosmos

THE DISTERNATION OF BAILWAY CARS.

The DIRECTORY OF ALLWAY GAR.

The running of a railroad in Germany is evidently accompanied with unpleasantness, if one may judge from the accompanying photographs The Potsdam shops, which are responsible for the proper main tenance of rolling stock, have been confronted with the tenance or rolling stock, have been controlled with the difficult task of disinfecting the cars. It seems that the coaches which return from itsusia are literally a-swarm with sermin. Even after the cars had been cleaned with true Teutonic thoroughness, there was channed with the Tentonic therougeness, nere was still the possibility that living disease germs might birk in the walls and hangings. It was therefore, the practice for some years to take down all the upbol stery curtains etc. and to clean.

rything thoroughly Natur ally, the expense involved we heavy and the cars were with held from service for a considerable time Moreover, there was also the danger of infesting the

shops and other cars

The problem seems to bave been successfully solved by Julius licen successfully solved by Julius l'intsch who applied to the rail way car a principle of disinfec-tion which has been successfully employed on vessels. His disinfecting apparatus consists of an iron cylinder built up of cast iron annular sections of 16 feet in-turns diameter. The inside length is about 72 feet. The cylinder is so sioutly constructed that it can easily support without deformstion s 30-ton car
During disinfection the air

within the cylinder is considerably rarofied by a pump, and as a result the outer oir exercises o pressure of about 1,900 tons on

the disinfecting cylinder Since the apparatus is n allowance has to be made expansion. Hence the cylinder is mounted upon ers, so that the apparatus can yield to an extent for expansion of about three-quarters of an inch in length, which is amount of average

Before it is run into the cylinder, all the windows Before it is run into the cylinder, all the windows and transcus of the car are opened By means of a rance a two-ton closure is brought against the opened of the cylinder A rubber gashet is employed to make the closure hermette. Huge boits hold the closure, gasket, and criinder together Steam is blown into the interior of the criinder Two hundred and fifty steam pipes line the interior of the cylinder all receiving their sup total length of all thes supply from the main pi total length of all these pipes is about 1% miles. In order to heat the air within the cylinder quickly and at 1% miles

uniformly, two blowers are set in so that all the air is motion, so that all the air is brought in contact with the boat ing tubes. Even during the cold cut weather the lemperature within the cylinder can be raised to 140 deg F in from one to two hours in order to heat an entire coach to this temperature, about five hours is required. After the car has reached the proper tem perature, the air is pumped out of the cylinder until a vacuum of 70 to 74 centimeters of mercury under the normal pressure is ob-tained. At this atmospheric under the normal pressure is ob-tained. At this atmosphere, pressure water will bell at 104 deg F Hence all moisture is avaporated from the car without injuring the parts by the exces heat in no other way is a in no other way is it sive he The uphoistery curtains, hang-ings etc., are not in the least in-

For very special purposes the ror very special purposes the cars may be disinfected with formaldehyde gas Ai the very first attempt a car was ther-oughly purged of vermin To make assurance doubly sure, and to test the efficacy of this formal

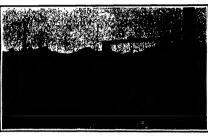

dehyde disinfecting method a giass vessel full of the living insects had been purchased from a professional vermin-exterminator in Berlin. This vessel was vermin-exterminator in Berlin This vessel was placed in the car and covered with cotton and linen The insects were all killed The apparatus has also been employe

wet cars as well as cars pervaded with the nu-pleasant odor of cooking. After twenty-four hours they were quite ready for service again. In this case no formalin was need

Liniment for Burna.—40 parts sugar lime, 10 parts giverine, 30 parts carbolic acid oil, 3 parts saiol.

SOVERWENT IRRIGATION IN THE TAXINA WATER-SEED -TER TIRTON CARTON CANAL. BY DAY ALLAY WY

The region adjacent to the Yakima River in ern Washington is the location of a group of irriga-tion projects which are notable for the engineering res. The topography of the country reveals a er of areas of arid land, separated by hill ranges which prevent water being distributed from a single source of supply The engineers of the Reclamation Service have made an investigation which extended from the lower portion of the Yakima River to its head waters in the foot bills of the Cascades, and

The huge cylinder in which German railway cars are disinfected by steam and aldehrde at Poissam after their return from a trip to Ru

have planned five reservoirs and distributing systems, which will have a capacity to irrigate no less than 350,000 acres, making this group of projects one of the most important in the West. The various works are the Trivoir, Sunnyaide, Wapato, Kettiras, and reference of the state of the st have planned five reservoirs and distributing systems

Of the projects, the Tieton is most interesting from scientific standpoint, owing to the difficulties a the route, the various applications of power, and th fact that without the use of concrete the project tunnel sections are of circular form & feet 114 in-

of circular form, 6 feet 1½ inches in diameter, with concrete shall 4 inches thick. This canal and tunnel lining are made up in 2foot lengths, manufactured on the flats along the river bank, where concrete ingredients are readily obtainable, and lifted to the canal obtainable, and ifficed to the canal line by cashe holats operated by alectric power. These holats are used successively at points about two miles apart, and the concrete shapes are transported along the canal between holats on railroad tracks laid in the bed of this axesvated route

This plan was adopted for the reason that beds of sand snitable for concrete were found in the bottom of the river in fact, the Tieton valley was made the site of a povel concrete works. The question as to how to transport them to the work was answered by the use of electrical power series of transacts were built at convenient points up the side of the canyon operated by cable

hoists These hoists in turn were served by a series of electric motors socuring current from a power station constructed for the purpose The concrete as fast as mixed was moided to the proper dimensions rast as mixed was monted to proper dimensions in portable molds mounted on wheels, so that they could be drawn from place to place. After hardening had taken place, the forms were set upon trucks having sides of steel framework. These trucks were mounted on the tramway, and the material bauled to

mounted on the transway, and the material basined to the top ready to be set in place.

On the Tieton project 10,000 feet of tunual were necessary, divided into two sections of 3,000 feet each and one of 4,000 feet in excavating these much of the formation was found to be or black beast rock requiring special machinery to remove it in making the tunnel excavation a circular bore 7% feet in diameter was driven by machine drills. Tielon River has

a fail of from 50 to 60 feet per ntie, and advantage was take this to develop the power re-quired for operating drills and other machinery and for lighting purposes A power canal 3,500 feet long, of 180 second feet maximum capacity and 34 feet effect tive head, has been completed which supplies water for operating a Frankiin air compres capable of compressing 1,250 cubic feet of free air per minute to a pressure of 105 pounds per inch, a Westinghouse generator to a pressure us as the control of 120 kilowatts capacity, and one set of 26-inch twin turbines.

About 500 horse-power is developed. oped, ample to operate the six electric drills, six air drills, shop machinory, pumps, hoists, etc., and to light all the camp build-ings. The turbine is regulated by a governor, and the power canal is provided with an ample autois provided with an ample numeric overflow, just below the power house. An electric transmission line, carrying 2,300 volts, has been constructed to the upper portal of Trail Creek tunnel, a distance of seven miles. Electric

Scaling the cylinder with a two-ten guakated closure before exhausting the air and turning on the steam.

THE DISTRIBUTION OF BAILWAY GARS.

would have been impossible through a deep canyon with very steep sides, the height of the bluff ranging in places as high as 400 feet from the bed of the river to the level of tha canal The water of the Tieten is diverted by means of a concrete dam thrown scross the stream Although of a concrete dam thrown scross the stream but three feet high and 200 feet long, the reservoir thus made is sufficient to fit is main canal 13 miles iong and lateral canals having a total of 51 miles. In one and several cannis saving a total or of mines. In conveying the water from the dam to the polent of distribution, the only practical route which could be located was isrgely along the side of the canyon near the top, the rim being of sech formation that it week

The molding yard, showing the concrete lining sections ready for delivery at the canal

The 4-inch concrete lining was built in sections in the valley and lifted to place on the side of the canyon.

Side-bill excevation for the Tieton canyon

canyon. The land, however, is especially suited to the raising of forage, fruit, and hope and is located on three important railroad lines having connections with the principal cities of Washington.

Omment for Burns.—Indatorm, 50 parts; extract of coall, 40 parts; carbolle acid, 1 part; rece unquest, and parts.

COVERSMENT IRRIGATION IN THE VARINA WATERSHED,—THE TISTON CANYON CANAL, To those of us who served in the Spanish war, and had the canned or corned best served us as a part of the require ration, the new will not come as a surprise, but the man who reads this will undoubtedly think of the good bee' he get as thouse and worder why complaints about he made.

One particular reason why the army will now use certain best in from the point of economy, for as meaning the contract of the particular of the point of economy, for as meaning the cannot be contracted to the contract of the cannot be contracted to the contract of the cannot be contracted to the cannot cannot be contracted to the cannot be cannot be contracted to the cannot be cannot be cannot be contracted to the cannot be cannot be contracted to the cannot be cannot b

It necessary for the War Department to submit a deficiency estimate to Congress. If the present rate of increase keeps up, the cost will be nearly 23 cents by the end of the next facal year. When it is considered the out of the local near year. When it is immurred that the army annually consumes several millions of rations, it will be seen that an advance of even a fraction of a cent in a single ration means a big advance in the aggregate for a year.

NOW GAMPLERS CHEAT

Games of chance have siways had a fascination for sil classes of individuals, at all ages, and the profes-sional sharp has made this weakness (which in some persons is developed into a ruling passion) a some persons is developed into a ruling passion) a means for carring an easy live libood at the expense of the numerous flats' who visit the race course or other places where gambling is looked upon as a num or less legitlante passion. The ingenious mechanical devices which have

ling along mechanical devices which have been employed for this purposes are really automishins. Such change appliances as loaded dries are, of course out of date thought one ingentious sharp invented a table line top of which was sheet steel ander a very thin cloth overling. By means of an electro-magnet concealed within the contraction of the contraction of the conwithin the table, lis top could be con within the case, in the control of the verted into a powerful magnet, and the dies (which were prepared by having one side of metal while the rest were bory) could be attracted to the table when the current was on or would fall in any hapshut of Dice, however are generally suspected and hardly anyone would ven fure to stake money upon the fall of the three card moute

three card mosts Cards are the most fertile field for the gambler's revenue. Winning at cards depends largely apon the possession of certain high eards or the aces which with the tricks and to gain possession of these cards is the gambler's object. For contribute, and the gain assuring this various devives have been employed called "holdonts" tuchanical conceiled in the sieve which by a wry slight pressure or movement in one direction, will instantly make the property of the contribute of the contrib certain high cards or the aces which the sieve of those was invented by a gambier named Koplinger and the de-vice has ever since been known as the Keplinger holdon! The appearing was worked by the kneen, so that no motion

worked by the anews, so that no motion of the arms or body was necessary A slight separation of the knees was all that was required to shoot the card into the gambler's hand. The knees were thereupon relaxed and the "holdout" receded like a fiash luto the sambler's sleave

Another variety of holdout is that concealed in the waistcost, and here the mind is need close to the body with the eards onispread while the thread is pulled, and in that manner a card abot into the hand ander cover of the remaining cards. This however, is a dangerous procedure whith is rarely employed. A small but ingenious species of holdout" is that known as "the bag". The small sharp point seen in the illustration is stack into the wood of the under

side of the table in such a man per that the flat bar runs alons parallel to and just touching the or more cards are now inserted into the clin thus formed, and may be withdrawn by the fingers in the set of drawing cards on the table loward the

A daring yet simple variety of 'holdont' is attached to the shirt sleeve under the cost and two small pointed books faring ontward press against the coat sleeve These books may be separated or brought nearer together by pressing upon a small ru If now a card be plaagainst the coat siervo, on the outside, and the clips separated outings, and the clips separated and then released, they will clasp the edges of the card through the cloth of the coat, and it will be retained there by the pressure of the spring in the "holdout." Bo long as the arm he held downward, the card is invisible, but the card may be

obtained possession of by the fingers of the other hand when resting against the sleeve of the arm to which the "holdout" is attached

A still simpler device is to have a small pocket out in the coat eleeve at the seam. The "pocket" is merely a slit about three inches long, into which the mereny a sur among tures menes long into which the required card is inserted. The fingers grasp the card and withdraw it with the others at-the required moment. Another variety of "holdowt" is known as

the 'ring holdout." A ring is worn on one of the fingers, to the inside of which is attached, as part of the ring, a small wire ellp or spring, flesh colored The card is inserted under this spring, and in that The card is inserted under this spring, and in that manner is retained within the paim of the hand by the pressure Experts in aleighted hand would not require a cilp of this character, being analied to paim the card without any mechanical aid.

sides such devices as those just mentioned, the

THE PLANCE ATT OUTSIT OF THE GAMBLES

gambler depends for his success partly upon his dex-terity in handling the cards during the actual progress of the game. Of course marked cards are frequently omployed for this purpose but the expert gambler will succeed in marking the cards with his thumb nail during the course of the play, so that, at the end of a few hunds he knows practically every card in the pack from the alight indications upon its back Rometines, also cards are bent more or less alightly to insure their recognition—either individual augnity to insure their recognition—either individual cards or a number of cards together. If half a pack is bent in this manuer this is called "the bridge" Each card in this section then has a slight curve, as

SOME GAMBLERS' TRICKS WITH CARDS.

Carrie Williams

A gambler may were deal to himself or to say person forming the circle a particular egrid which is known to him. This card is at the bottom of the pack, and the "sharp" deals of the cards from the pack, and the "sharp" deals of the cards from the part of the cards continuously ustil he reaskes the person into whose hand he desires to pince the card next to him, when, by a rapid movement, he withdrawn, not the top by the bottom card with his algave instead of his, distant. This track, when

vapidly and well eigensied, is practically undetectable. Ourd "sharps" also establey other devices for galaxia knowledge of the cards dealt to every member in the mirror to make this benefician, a small mirror is explored. Securities, as small tabled to a pulsely flower, and fixed to the under note to make point, and fixed to the under note of the table morest the dealer. If, now, in dealing, each card be passed over the mirror in term, the gambler will be enabled to tell the position of the gambler will be enabled to tell the position of the dealer of dealt, and to follow the cards before a single play on the made. A mirror of this character in a deagerous device, and it is easily detected. The contract of the cardy detected. In order to gain this kno

Appl. 16, 1910.

a single play can be made. A mirror or this character is a dangerous device, and it is easily detected. For this reason, very ingenious schemes have been em-ployed. A small mirror is inserted into the bowl of a pipe, laid carelessly on the table, the bowl being turned slightly upward and toward the dealer. Now, in upward and toward the dealer. Now, in dealing the cards, they are passed such in turn over the hori of the plps, and in this manner the magnifying glass it on tains conveys to the "sharp" all the re-quired knowledge, as to the cards con-tained in each sitter's hand. Occasionally "sharpe" employ a mirror ring for they purpose, a large signed ring being used which during the course of play, is evenus avound so that the signet faces the paim instead of the back of the hand. The signet then swings open on a pivot hings and discloses a tiny magnifying mirror beneath By the aid of this nitror, the majority of cards can be destected as dealt Al least aces and court cards can be distinguished from cards of lower values, which is the chief the court cards as the distinguished from cards of lower values, which is the chief There are a number of other ingustous devices employed by professional sharps, but the above will at iteast give the reader an idea of the extent to which the practice has been carried, of the re-

this practice has been carried, of the remarkable ingenuity displayed by me facturers of such devices, and of the dexterity and daring of the gamblers themselves in employing them.

Macrographic Examination of Metals The macrographic examination The macrographic examination of metale consists in examining with the naked syst its surface of the metal, which has been polithed and the chemically tracked in such a manner as to bring out the constitution and its importies. In uncovarphile to the constitution and its importies, in uncovarphile active and the constitution and its importies. In uncovarphile active active are the character and chemical properties of the alony, while macrography concerns their with the physical properties. The principle of the methods used in as old as the first methods of demaconish in which an acting interest the strips of I rong and side in which an acting in which an acting in the constitution of the contraction of the c

word blades.

The operation of macrography are essentially two first, the preparation of the policible durates, which must be absolutely free from greese, so-ondly, the chemical treatment, which is preferably effected with distinct scaphuric acid, in which the entire piece of metal is immersed for several hours. is immersed for several neura, or with an agreeous solution of iodine and potassium iodide. The indications furnished by the examination of the surfaces thus treated are useful in deter-mining the quality of steel and detecting the presence of slag and of biowholes When a bar of metal is cast there is freor mean is cast there is re-quently produced near the sur-face a blowhole which is filled with the more fusible impuri-ties. Usually this pocket extends through one-third of thickness of the bar Mi graphic methods show wha the blowholes have been a erated either by pressure or removal of the upper part the bar, and they are also a able of detecting in far pieces traces of th

which have been left after the tools

The statistics of the American Entirety Association show that the not surplus of breight care on the pash ways of the country on polescape 16th was 15400, as against 34,075 on Pubmary Smi: 26,546 or. James 18th; and Smil for Pumper 26th. The Increment do mand for bur care and past care has the second of the country of t

EIS TIX TREES OF TEE SUBTRIVET

The fir trees of the Faulie Northwest occasionally attain such proportions, especially in the territory attain such proportions, especially in the territory best out down are sumployed for novel purposes. In some portions of Washington one can see these bug stumps, which have been hollowed out and actually made into temporary homes for settlers. To make a stump hours, it is only necessary to remove the material from the interior, leaving enough to form walk or simple histories. Fine a root of boards or in the territory of the control of t gies is put over the top of the stump, holes are cut for windows end doors, and the dwelling is practically ready for occupation. A number of these stumps have been used by settlers on what are called logged-off lands, until they have been enabled to construct larger lands, until they have been enabled to construct larger and more convenient dwellings. After the stump home has been vacated, it is turned into a stable for the horses, or sometimes into an inclosure for chickens

or hogs.

Next to the big tree of California, or sequoia
as it is termed by the scientists, the fir as
found in Washington and Oregon
has the largest diameter of any

has the largest diameter or any tree in America, and probably in the world Soms have been cut down which actually measured 15 feet in diameter at the point where the incision was made. As they decay very rapidly after the timber has been removed, usually the in-terior can be hollowed out with little difficulty Sometimes they are used for dancing platfo is shown in the accompanying illustration, some being large enough to accommodate four couples. An other custom is to turn the hig other custom is to turn the hig stumps inlo playgrounds for the children, who reach the lop hy pieces of wood nailed against the sides or by ladders, and a pretty sight which a travelor often sees in the northwest is one of the big stumps turned into a flower bed and covered with the trailing vines.

How to Repair and Clean Typowriters, BY LOCK A PLANNING

As every user of a typewriter knows, the platen or roll is the part of the machine that wears out The constant hammering of the type against the surface of the piaten soon makes indentations in it, which in a short time amount to such a degree of roughness that it is impossible to produce good, clean

A compound has recently be discovered that will restore the platen to its original smooth condition no matter how badly it is worn

tion no master how badly it is worn or how long it has been in use. The formula and method of using the compound are as follows. The ideal material for use in repairing patterns would be hard enabler, but discussed the pattern in t amyl acetate, and various other solvents One of the best solvents

is a mixture of eight ounces of acetone and one ounce of amyl acetate.

of anyl acetate.
In the absence of anything sligh in the way of ceillu loid, any ordinary article made of this substance, as a count, may be used There is a variety of ceilluid used in the manufacture of combs which is quite set-inattenty for this purpose. The color also is good where this variety can be obtained.
In sufing cultiloid on plateins it is advisable to use outside, which is that will give it hardness, such as such powerful to the control of
similar substances. About one ounce of powdered emery to each eight ounces of compound is a fair pro-portion. Powdered soapstone also works well for the

The collision solution should be made as thick as a very heavy surper or molessee. In fact, set thick as skey be spread with a broad "The heavier it is when him, the somet's will set if it ight colored collision is used, it is, advisable to add some coloring major, which has he immediated as redeshably use of section of the coloring major is the coloring major, and the coloring major, and the coloring major is a set of the coloring major is a set of the coloring major in the coloring major is a set of the coloring major in the coloring major is a set of the coloring major in the coloring major in the coloring major is a set of the coloring major in the coloring major in the coloring major is a set of the coloring major in the coloring maj The celluloid solution should be made as thick as

grayish color Remove the plates from the machine. The work may be done with the plates in the machine, but great care must be taken to protect the working parts from the dust formed when smoothing up 1 it also takes less time to do the work when the plates is

removed

Wash the platen with gasoline to remove all grease
and dirt, and ruh it with a piece of fine emery paper,
to give it a new, clean surface With a brush, paint
the mixture carefully over the platen, giving it a good
thick cost,

Lay the platen aside for six bours or longer fo composition to harden. Then with a piece of fine emery cloth smooth it down, taking care not to cut quite to the original surface of the platen. This is the delicate part of the work, and upon the care used in doing it depends the quality of the job

doing it depends the quality of the job
Acetone and amyl acetate can be obtained at any
drug store. It usually requires from two to five hours
for the celluioid to dissoive. Breaking it up into small pleces hastens solution The solution should be pre-pared in a wide-mouthed bottle that can be securely

corked it should be shaken often during the process as this will prevent the colluioid from forming in lumps The bottle should be kept tightly corked and away from fire, for it is highly inflammab the mixture become too thick, thin it with a little more of the solvent, if it is not thick enough, add mor celluloid

empound for type

A cheap and simple cleaning compound for twitters is composed of the following ingredients
Paraffin oil 1 pint
Bensol 5 ounces

Karo

Karosene Mix thoroughly
This compound was for years a secret confined to
one or two of the large companies that rebuild type
writers. The machine is immersed in the compound
writers and removes which quickly and thoroughly dissolves and rem which quietly and thoroughly quisoriers and removes all dirk, gum, grease etc. It does not injure the enamed, but on the contrary improves its appearance parallel of an abright as when new in making up any making its abright as when new in making up any making its abright as when new in making up any tions given in the formula, except that should quicker drying mixture be desired the quantity of paramn oil may be reduced and the kerosene increased In all cases the lightest grade of paraffin oil should be used and not the beavier lubricating oils if white paraffin oil is used a water white fluid is produced. If dark paraffin oil is employed the liquid has a light amber color Oil of citronelli or oil of sassafras may amber color Oil of citronelli or oil of sarsairras may be substituted for the cresol which has no action whatever and is used simply to disguise the composid tion of the compound. To use the compound fill a tub of sufficient size with it. Place the machine in it and allow it to wought in the fluid for half an hour R litting it up and down gum and grease will be washed off. Then remove it and dry it with a soft cloth brush ing the parts not accessible with the cloth. About t The compound may be used as long as any of it is left as the dist settle a to the bottom of the tab and the clean portion may be drawn off. It is necessary to keep it covered tightly when it is not in use to prevent evaporation of the beard. A fair preparation may be

made by using one-third the quanformula an equal quantity of keroand from one and o two times as much gasoline

-----The Transformation of Sea Water

Into Fresh Water The belief was prevalent among the savents of the 17th and 18th carthen vessel dipped into the sea would fill itself with fresh water At the present day it is difficult to say on what this belief was ground ed it surely could not have been cd it surely outd not have been choiced by experiment in a similar sense Marsigli, the founder of occasiology made in the year 1726 and experiment which effected infiration of sea water through a system of fifteen poles filled with washed gorden earth or sand and placed as to let the water fall as If in a cascade it is stated that the palate disclosed a definite distinuition of the presence of salt Similar assertions are everywhere current among soumen A selentific test of the endeavor

to free sait from water was recent ly made by the French investigator Thould His report which appears in the minutes of the Académie des Sciences of Paris states that the presence of sait can be reduced by filtration forty continueters of the length of a glass tube which was one meter long and was placed in a perpendicular position was filled with seasand and the rest of the tube was filled with sea water por tions of the filtrate were examined at intervals of the experiment to ascertain its density and chemical composition. The result was that in the initial stage of the experi ment density as well as sadine can tent were found to be moderately reduced very somether after both recovered their original value The arly decrease of value is explain he the morbanical attraction which every chemically nentra body exer clars on the malecules of a substance in solution as soon as the body comes in contact t ith the so-

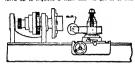

iution in nature too wend fails to effect the separation of sait. Through shipwrecked scames it became known that relatively fresh water may be found on very low and harren corn! rethe Pacific Ocean by digging to a trifling death in the coral sand it is not however as was supposed sea water freed from salt through the layers of sand but is simply rain water that is retained by a sendy stratum and by it protected from admixture with the ses water. Similar phenomena may be observed on the European coasts. They may be considered the key to the popular belief now contradicted, that water can be awestened by filtration through sand

According to the Electric Railway Journal, a novel type of electric locomotive has recently been built for canal haulage near Bremen. The locomotive runs on a quay which has to be kept clear for the passage of drays and for other purposes. To secure the necessary weight for adhesion it was decided to build the loco motive in the form of two U's with a connecting The current is taken from overhead wires

A TOOL FOR CENTERING WORK IN A LATER

The accompanying drawing shows a handy tool for entering work in a lathe chuck. When a job is to be faced off it requires a little lime to get it to run

SIMPLE METHOD OF CRETERING WORK IN A LATER.

true The drawing shows how the work can be expedited by the use of a simple tool. The tool is made of tool steel, the roller is hardened. When a job is placed in the chuck to be faced off and the face of the work does not run parallel with the face of chuck the work cose act run praises with the race of cause to roller tool is secured in the tool poet, and the lathe carriage is then run up by hand until the roller strikes the face of the job. As the work weblies in the chuck the high position will be struck by the roller and forced true with the face of the laths. After the work has bedd trued it is then ready for marbling

ALRING A LEAR IN A STEAM OR WATER PIPE hole will occasionally cause e leuk in a at or water pipe, after the piping bas been put up and perhaps been in use for a considerable time. It can be repaired with an ordinary carriage clip and yoke

MENDING A STEAM OR WATER PIPE

and bit of sheet rubber packing, eithough a piece of an old rubber shoe would last for years

an old rubber show would last for years. You can readly see the application by referring to the sketch. The writer stopped two leaks in steam pipes fifteen years ago by this melhod. The opines have been in service were also been in service were also been in service were also have not leaked. They exer both in rather inaccessable places, where it would have been difficult to remow the pipe. At the same time bring in out-off the-way places the appearance of the properties of the properties. the patch did not matter

GROOVED PULLEYS FOR EXPERIMENTAL WORK

Small grooved pulleys or sheaves can of course be d on the lathe but a substitute for the lati which in some respects is quicker and cheaper, will be found very edvantageous. The description of such a method follows

a menog rollows
in a piece of wood of the thickness desired for the
pulley bore a hole of a diameter equal to that of the
pulley at the boltom of the V-groove With a half
round rany or large drill counteraink this hole on both Suilt-do not say-the board in two down the

MOLD FOR CASTING PULLEYS.

middle of the hole, then nail or clamp it tightly to a smooth board the two halves being pressed firmly together. Find the center of the hole with a compass and drive in a headless sail taking care to get it vertical, to serve as a "core" for the bearing. Have handy a piece of cardboard considerably larger than the pulley, with a hole in its center the size of the

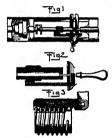

slip the cardboard over the nail and down upon the miold This will force out superfluous metal and make the upper side of the pulsy smooth When cool, unclamp the mold and pull apart where split. A knife or rasp will then do all the finishing necessary Two or rasp will tend do all the miniming necessity. Two or more pulleys can be east together by placing the moids one upon the other, with their centers common. The figures above such a combination. A bub may be made in a similar way. If a stronger bearing is wanted, as of an idler, wrap a strip of brass around the nail and let it become soldered to the metal.

iet it become soldered to the metal.

Along similar lines a cogwheel may be cast, but
great care is necessary in cutting the tech in the
wooden mold. A large number of pulleys can be cast
from one mold, and for duplication work this method
will be found quicker than the lathe.

HOW TO GUT THREADS WITHOUT A SCREW-GUTTING LATRE OR THREAD-CRASING TOO

The ordinary way to cut a thread by hand is to use a thread-chasing tool with the number of teeth per inch wanted. The difficulty in chasing a thread is in the starting. It takes a great deal of practice, and over them a "drunken" thread may be the result. The accompanying illustrations show how this can be done in a very simple way and yet give an absolute the starting of the starting thread the starting thread the starting thread
intely true thread If a number of arraws are to be cut the best way to proceed is as follows. Take a thin place of tubing that will just if to vor to har or belt to be threaded in one end drill a small hole, into which fasten the and of a aprise brass wire, preterably by soldering Then wind the wire around the tabe half; a doesn or more turns. Now take a thread gaze Select the number of threads per both wasted and place il length-wise of the tube, when if a cach wise of the tube, when if a cach when of the tube. I when it is cach to the control of the cach when of the tube. I when it is cach to the control of the cach when of the tube. I when it is cach to the control of the cach to the tube of the tube.

SCREW-CUTTIES ATTACEMENT FOR LATERS.

notch, after which puil the free end of the wire and keep it tight Solder the coils to the tube, using only the corner of the soldering from them more the gage one-third of a turn around the tube and repeat the soldering and finally move the gage again an equal and solder

it will now be seen that there is a perfect thread or it will now be seen that there is a perfect thread or spired around the tube, which we will call the masser thread. This master thread must be slipped on the hor or boil to be threaded so that it will not turn, allowing enough room at the end for the threads to be cut. The cutting tool consists of an ordinary hand tool, with only one point. Procure a small piece of wood, joing shough to reach over the master thread and to the end of this boil. Into this piece of wood and to the end of this boil. Into this piece of wood

and to the end of the hott. Into this piece of wood crill a hole just large seconds for the cutting tool to slip through and dit saught in operation the cutting tool is held in the right hand, in the usual way. Then with the left thumb press the piece of wood against the master screw and start up the lather. The master screw will feet the cutting tool the right pitch has soon as a good start is obtained the tool will feed itself without the aid of the master screw. the master screw

When the thread is finished the master screw may oved and slipped over another bolt to threaded. The spiral may be wound right or left, according to the direction wanted. Any number of threads may thus be formed. That is to say if a triple torsass may thus be formed. That is to say if a triple or quadrupic thread is mantal, it is only necessary to wind three or four wires around the master thread and proceed as before described. This arrangement is also very handy in starting a thread when the ordinary chaser is used, as it will always insure a straight thread. It is not necessary to nick or mark the wooden block, as it readily takes the impression of the thread from the master screw

Fig 1 illustrates a plan view of an ordinary lathe, ready to cut a thread. Fig. 2 shows how internal threads may be out and Fig. 3 shows the mester thread.

STATUS MATERIAL OF PURDISO THE CHITES OF A OLEGIA.

Very often it is necessary in the drawing room or shop to find the center of a circle, a disk or a p of shafting, etc., when the diameter is not given low are three ways in which this can be done

low are three ways in which this can be done.

The first, Fig. 1, is the method usually used it consists of two right triangles drawn so that their angles are in the circumference of the circle as a bo and dcf. The point where their hypotenuses inter-

and αr in point where their hypothesis intersect is the conter of the circle

The second method is shown in Fig. 2. Draw any chord as ab and take two points on it as ab quidistant from its ends. At these two points erect perpendiculars to ab cutting the circle at ef g and b. Then

THERE WAYS OF FINDING THE CENTER OF A GRECLE

draw i h and fg, and the point where they inter

draw 'h and fp. and the point where they intersect will be the center of the circle Fig 3 is similar to Fig 2 Draw any two chords as ab and cd and at their centers erect perpendiculars to them The point where the perpendiculars meet will be the center of the circle

HOW TO SHARPEN A PIPE DIE,

NOW TO SHAPEE A PIPE DIE.

FY ALPHADY IN BOTH A millicut file would sharpen a solid pipe file quite easily and cubilly without removing the temper in the die. The first fow rules of the file will side without cutting. But for the pipe file file just in the pipe fi

A PIPE DIE CAN DE SHARPENED WITH A FILM,

the flic will commence to cut, and will cut very smoothly making a keen odge on the cutting thread Herestofore I have slways worked on emery grinders to try to do this work without removing the temper of the die, but found they worked very slowly on account of the small diameter of the wheels, also that it was quite a nuisance to set the die for the cutting wheel Most mechanics would not try the file not having the least idea that it would do the work That

A "SPANISE WINDLASS."

Herewith is a sketch of what is known among cowboys as a "Spanish windlass". One end of the rope is made fast to the load, the other to a "dead man," tree, or fonce post. The vertical post or timber which is used as a drum is rotated by means of a bar placed in a nearly horizontal post-

A "SPANISH WINDLASS."

tion bearing against the vertical post but not fast-ened to it. The rope is passed around the end of this borisontal bar

horizontal bar
One man holds the post against the ground and
vertical, and a second man walks around with the
bar passing it above the rope, and time winding the
rope on the vertical post.
The whole windings moves toward the "feed many?
as the rope is weight, on my previous and and any

made in the ground for the vertical post to turn in al for pulling wagons a This windians is very useful for pulling wagons and autos out of the mud. All one needs is a rope and two posts or timbers.

THE WRIGHTING OF TOOL WANDLES.

How often it occurs that when a tool such as a brad awl or particularly a keen-edged chisel is thrown down in a hurry it will roll off the bench and fall upon down in a nurry it will rul on the south and and are upon the floor, perhaps into a give pot or upon the foot of the workman, or on a hard surface that will nick or duli the cutting edge The following little scheme is dull the cutting edge. The following little sceems is employed with all the wood-working tools of the writer and found to answer admirably. Bore a hole in that part of the handle that rests upon the bench, with a five-sighths rather dull cutting twist bit. Bore the hole only as far as the center of the handle, but no farther, or the object desired with be defeated. A dull cutting only as far as the center of the handle, but no farther, or the object desired will be defeated A duil cutting bit makes a rough-sided hole. Into this pour some meited lead (of course the lead should not be too hot). When the lead becomes set, trim it off evenly with a fine rasp and finish off with coarse sand paper. Now when the tool is thrown down hurrledly upon the work bench it will not roll over more than once and will come to rest leaded side down. This little dedge is not only inexpensive, it is thoroughly effective, it will not only save annoyance, it will prevent many an accident, which no one can realize more than the man who is handy in the use of wood working tools

BRAD AWLS WITH MANDLES WEIGHTED TO PREVENT BOLLING.

The illustration shows two brad awis, fitted as described, and used by the writer for several years.

AN ILLUMINATED GAS REATER.

The accompanying illustrations show how an illuminated gas heater can be made. The heater is mounted on a suitable pedestal, such as a wrought-iron stand or a base of some old discarded oil lamy. The heater proper consists of a hurner A, a serven R, and an outside cover or shield G, which is removable. A suitable handle is provided at the top of the cover

A striang name is provided at the copy of the purpose

Through the base passes an ordinary gas pipe, and
at its lower end a stop-cock is fitted with a suitable
attachment for a rubber base so that it can be connect
ed to the gas supply in the usual manner. At the upper end of the gas pipe is attached an adjustable sie sau of the gas lyne is attained a substance when the for regulating the proper proportion of all to be mixed with the gas. The sleeve terminates in the burner proper, which is made with double walls. The lower part is made conical, so as to better distribute the mix-ture of gas and air. The hurner proper is made from ordinary culluary utensits, the husdee part from a ordinary culinary intensite, in a made part from a small pan, and the outside part is made from a col-ander with very small holes, the smaller the better These two parts are rivered together at the top, so as to make them tight. The lower or conical part-may be made from ordinary black iron and may be fastened nade from ordinary black from and may be instance, to the upper part as well as to the lower or gas pipe in any suitable manner, as by riveting or seaming. The screen is made of wire netting fastened together,

any stitute inhiner, as by riveting or seasing.

"The screen is mused or vive notification to the control of th

number of holes at the top should be made for the circulation of the air and spent gases.

The cover may be cut out or perforated in such a

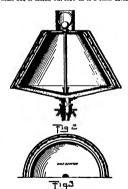

to represent a landscape or any conventional The inside of the shield may be lined with ray as to re design The inside of the shield may be lined with mics so as to render the beater more asfe. The mics may be thited in almost any color desirable Aniline colors are dissolved in amyl accetate, then mixed with amyl acetate colledion (commonly catted banana cill This mixture is applied with a soft brush and will It will withstand a great

tage in a dark room. The outside cover is not at all necessary, but is only used to get the desired effect.

FILES AND THEIR USES.

Nearly overgross who has had much filting to do, knows what a difficult thing it is to get hold of a reliable handle Wood ones will split even if forruled, or the brass ferrals will become battared and weaked. Sized cone are rurnly substanted, and the settlement of the settlement o

end of the file handle turn two %-inch grooves, plac-ing them % inch apart. Connect by two diagonal grooves of the same size, wrap with a piece of paper, and pour Bablit metal or solder in the top Trim up, and you have an everlasting file handle

A simple and inexpensive file cleaner is made by hammering either end of a medium or large sized

an imple either expected to institution. The supervised monitoring the this degree of hardness is not essential, the temper al ould be drawn by heating and cooling down slowly in order to render the steel less brittle In fact, the temper and quality of a good file are instanced by tha fact that the writer has seen made and has tried satisfactorily a razor ground from a 10-inch flat mili flie on a regular emery wheel and then honed and stropped into shape

Perhaps the first use I ever saw old files put to was revising the first use | ever saw out make put to was a full set of nail sets made from 6-linch triangular files by snapping them off to an even length at five links and grinding the points down to various sizes required. The top ends were rounded off nicety, and the treth were ground just enough to give a beautiful kuuried effect to the set 1 asked the mechanic who made these tools why he hadn't used rat-tail files and make them round, but he said he just wanted them different from the common run of tools. Same years later I did have the pleasure of sceing a leastiful set made from round files. Only with these there we left an unground strip between the two ends, to affor a good grip for the fingers

Another splendid set which was evelved out or

by a machinist who had oversion to do a tittle see int by a machinist was and occasion to do a nature ejection institute making from time to time, was a complete set of fittle V-shaped gouges and flat chissis and half rounds, all made with curved shanks to reach other than the complete of the wise list consible pister. These were made by forging amail files of the requisite cross section into the curve required, and grinding the shank and edge to the tool required, and grinding the shank and edge to the tool claimed by requisite cross section I mean that he niverse (took a flat file to make a flat their and their final grinding and sharpening. The tange do to the two same and their their and their and their their and their also their and their an

a convenient length, may five inches grind a good long taper on it up to the last % of an inch, and make the taper shorter to give more metal to the point, and there you are

Sometimes a file will help out a serious difficulty if it is only used. An occusion arose in which it was absolutely necessary to shear off some large spikes in absolutely necessary to abser off some large applies in some builting timber that had already been placed in a builting. It looked well nigh impossible until I al-thought to sharpen a fite to a redge on the blunt end similar to a cold chiefs, and by driving this in be-tween the piles it was a simple matter to cut the spikes, though to tell the truth it spoiled the edge of the file several limes before they were all cut. Perhaps the toost common use to whith they are put is to make them into burntshers for sharpening calibate arrapers and kindred tools. For those they are simply mounted in a handle and ground until

calibet arrapers and kindred toots For these they are simply mounted in a handle and ground until they are perfectly smooth "Triangular files are the ones commonly need for this purpose. A round file makes an efficient and for any purpose and with accrety any trouble to transform it ready for fits new duties as it needs only to be sharpened. An amateur desiring to take up hrass craft work, and not wanting to pay the exorbitant price powersity wasted for an outfit, deeled to make one from fits In less than two hours he had made every tool lile In less than two ours us as many every occurrent trated in a large assortment, and they were a credit-able-looking outfit, comprehensive enough for any ordi-nary purpose, and included all the customary plarcing, deating, tracing, and stippling tools.

ding is required to see this signal

nange from danger to clear At all stations a record is kept showing the departing time of every train at this station and at the next station east and west. Supposing a west-bound train to be west. Supposing a west-bound train to be approaching a station semaphore. The telegraph operator, if he has no orders on hand for this traio to meet anything at his station, consuits his block record, and if the block west is ricar he calls up the station west, and obtains permission to let a train in the block life then pulls his block signal clear and holds it in this position until the train is by, immedi ately reporting it to both block stations and the dispatcher

If a train from any cause has to stop between stations or finds itself on the schedule time of a superior train it has to flag, putting down torpedors and send ing a man with a red flag ahead and back ing a man with a red flag ahead and back notwithstanding the knowledge that the telegraph operator will not let another train anter the block until it is clear

Now, on double track things are very much simplified, as all trains going in one much simplified, as all trains going in one direction move on the same track, and only have to take siding to silow a train of higher class to run ahead. This silows the use of automatic electric hiock signals placed at intervals of about a milo, all signais being on the right hand side of the track which they govern At every one of these signais the joints between oce of these signals the joints between the rails are insulated, thus cutting the tracks up into blocks between the signals. These signals are so wired that when a train approaches one of them, if the block ahead is clear, the circuit will be com-ploted from one rail to the rail on oppo-site side of track through the wheels of the train, causing the signal to come clear, in which position it stands until the engine passes it if one of these signals engine passes it if one of these signals falls, the train is required to wait a min ute or two iong enough to allow a pre-ceding train to clear the block or to flag, and then proceed with caution to the next al, reporting the failure at first office

These automatic signals work over two thousand times to one failure, and ore so rucied that a failure leaves the sig nal at the danger position

stimation of the Working Caps a Man Before and After an Accident.

The problem of determioing the work The problem of dotermioling the work ing capacity of the within of an actident in divided into two parts—it is necessary to establish, first, the condition in which the accident has left the various cragso and functions of the body, and secondly, the effects of the consequences of the accident upon the power to work, either at the states a surgicus occuration. the victims previous occupation, if he is able to continue it, or at such other occu pations as he may be able to carry on Dr imbert in a receot article criticises the methods generally employed for the solution of this problem. The attendant physicians and the medical experts give physicians and the medical experts give only their personal opinions, instead of employing the exact methods of examina-tion which are used in physiological labotion which are used in physiological labo-ratories. Thus in many cases, in which the statements of the victim appear false or exaggerated, the truth could easily be ascertained by the use of X rays or by the electric exploration of the nerves and muscles D in Imbort describes various researches which he has made in the physiclogical study of certain occupa-tions. He thinks that it is possible to arrange a mass of useful data in a form in which they would be available for the decision of individual cases.

That apparently most remote of the sciences from the exactness of physical laws, economics, has been brought under isws, economics, has been brought under the treatment of mathematics, not only by statistical methods, but by methods of the calculus. The distinguished mathemati-cian and comomist Couract applied to the theory of wealth methods like those in mechanics to treat of equilibria, so that very complicated economic prin-

In almost every field of work men are accomplishing more in less time with the Bell Telephone than they could without it. They can talk with more people, near and far; they can keep the run of more details; they can buy or sell more goods, and to better advantage, they can be active in more affairs.

The Bell Telephone has placed a new and higher value upon the minute - for everybody. It has done this by means of One Policy, One System, and Universal Service.

Bell Long Dutance Telephone service not only gives an added value to a man's minutes—it accomplishes business results which would be absolutely impossible without it. Every Bell Telephone is the Center of the System.

NEW YORK SATURDAY, APRIL 23rd, 1910 The liftit is always glad to receive for exactnation literated articles subjects of timely interest. If the photographs are sharp, the articles short, and the facts curlengte the contributions will receive special statution. Accepted articles will be past for a regular space rate.

TRUE WAY TO PREVENT BAILWAY ACCIDENTS.

) is well understood among railroad officials that the most fruitful cause of railroad accidents in the most trainful cause of railroad accidents in this country is to be found in the lax sense of discipline among the employees Presumptive moof of this is found in the fact that, although our icading railroads have been equipped with a block signal system and other safety appliances, which are suparal system and order easily appliances, when are generally equal and in some cases superior to those on European railroads, the number of accidents in proportion to the number of people carried continues to be larger in this country. We therefore note with much satisfaction that the thit ago and Northwestern Railway has taken a step to the right direction by appointing an official whose chief duties will be to make a study of railway accidents, and by a system of education and strict enforcement of discipling, en deavor to eliminate the most fruitful cause of injuries deavor to climinate the most fruitful cause of injuries to passengers and damages to freight Opportunity was recently taken of the reorganization of the companys ciaim department, to relieve the claim agon uf much of the detail of his work and silow him to uf much of the detail of his work and silow him to make a careful study of the causes of all accidents in the handling of passengers and freight it will be his duty to bring about a more thorough co-operation and a higher state of discipline among the various em-pluyees, upon whose fulfillment of their duties the asks operation of the trains immediately depends The scheme is a most excellent one, and we believe that its results will be so satisfactory as to lead to similer arrangements on at least the more important railroads of the country

AN EPOCH-MAKING EXPERIMENT.

T the last meeting of the Institution of Navat Architecia, a paper was read by the Hon C stop among the British navel architects and winn among the British navel sreditects and shipbuilders: It was described by Prof J A. Ewing of Cambridge University as speech making", and the amonumentests which it constained must be considered as as end only in importance to those which were unude by Mr Fernons after the uncoresult irlaid of his mix turbine drives steamer. Turbinis of Mr Farnons apper which was entitled The Appill sation of the Muricu Steam Turbine and Mrchanick in tearring in Merchant Ships. Gen Fibe the sucvessful

application of a combined steam turbine and reduction genr to a slow speed merchant steamer, the "Vespa-The Vespasian' is a small cargo stear less than a thousand tons displacement, which in her original condition was driven by reciprocating engines which were sufficiently up-to-date to be considered as whith were summinently up-to-date to be considered as expresentative of the average engine-room equipment of the modern tramp steamer. To make certain that the comparison would be trustworthy, and equally as orable both to the reliprocating and the turbine institution the reciprocating engines were throughly over-instead and put in first-base condition. The ship was then taken to see and put through a course of trials in which complete data relating to draft. weather water and coal consumption etc. were co letted. The vessel was then returned to the yard the returns the year was men returned to the year the returning to the year the returning team turbine with a 1 to 40 reduction gear was unusuited, the projector used with the reciprocating engine being left nutouched. The reduction gear consequences alsted of pinlon- on the high-pressure and lew pres turblus shafts and a large spur wheel on the propeller shaft. The gears were of cast iron and the whole was mounted in plain bearings without the use of any special adjustment devices. The "Vesposalan" was then coken to see, and put through a similar course of

trials to those which were run with the reciprocating engines Except for the aubstitution of turbines for reciprocating engines, the ship with respect to dwaft. otlers, and propeller was in exactly the same condition as in the first trials.

When the results came to be worked up, it was found that with seventy revelutions of the propeller, there was a net gain of from 15 to 16 per cent when steam for all purposes was considered, and of from 18 seem for all purposes was considered, and of from 18 to 18 per cent for the propelling engines alone Translated into terms of boiler power, this means that one boiler out of every six in the slow cargo boat can be dispensed with

Speaking of the important question of the strength of the mechanical goaring Mr Parsons stated that as the 'Vespasian' had been taken out in a heavy sea without experiencing any trouble with the reduction gear, it was probable that the gear would stand any thing that the shaft would stand In the discussion of the paper various shipbuilders referred to the longthing that the sinse violated in the class of the paper wireless shipbulded and refer to the long-standing preludic against mechanical artist, and it is not the importance of the control of the paper of the control of the paper of the control of the paper of the control of th

by the use of helkel gearing, which is the type that was used on the 'Venpasian,' it is possible to transmit large horse-powers with an inappreciable amount of west and with an efficiency of over 98 per cent, which is about the same efficiency as was secured by Mr

Now the vest importance of these 'Vespasian will be approciated, when we bear in mind that about two-thirds of the steam merchant marine of the world is of the slow cargo-carrying type, for which the steam turbine, because of its high speed of revolution, has been found to be unsuitable. Moreover, the 'Vespasia was the first vessel to be fitted with the new system and it is reasonable to conclude that with system and it is reasonable to conclude that with its further application to argo steamers, an average economy of at least 20 per cent will be guaranteed on the engine and 17 per cent on angine and auxiliaries, or as Prof Ewing put it, there will be a saving of one boller in six on the whole equipment.

nonier in mix on the whole equipment.
Furthermore, not only will there be economy at the coal pile but the reduction in weights will make possible a considerable increase in the exponentrying upacity in this connection, it should be noted that opacity in this consection, it should be noted that the United States Navy Department has authorised the installation of Westinghouse turbines with Melville and McAlpine gears in the new fleet collier No. 8, which is being built at Sparrows Point, Maryland i he space and weight saved by the use of this apparatus as compared with the reciprocating engines originally continuousled for this vessel, will enable it tons more coal, and it is belie to terry about 200 tons more cost, and it is such that the economy in coal consumption will be such that the economy in coal consumption will be such that the saving thereby effected will add another 200 tons to the net carrying capacity of the collier

WATERWAY DEVELOPMENT IN RUROPE AND THE

E noie that a contemporary sounds a word of warning ngainst precipitate action in the wholesale development of the water-ways of the United States, by drawing attention to a document issued by the British Royal Commission on canals and waterways, which it cun aiders to be worthy of serious study on this side of The report deals with the wa of Beigium, France Germany, and Holland, and our contemporary advises that it be studied in connection columporary advises that it be studied in connection with the revent report of the army engineers on the proposed 1-frost saterway from the Lakes to the Guilf III selatine that the Royal Commission report strongly mutatine that the Royal Commission report strongly mutatine that contention of the army engi-neers that the Musicipipi and the tributaries, with 11000 miles of navigable waters, as developed and mutatiated by the government, furnish as good as

multitationed by the government, furnish as good an intand vastermy system as any in Europe. In France the waterways that are used considerably include a total of about 7,500 miles of rivers and canals, and of that 1,500 miles of rivers and 1,671 miles of canals have been deeponed to a minimum depth of 6 8 and to a maximum depth of \$5 ceek, the bulk of the traffic being carried on water varying from 1 to in depth down to 15 feet.

in depth down to 15 feet.

In Germany there are 8,500 miles of waterways, the dapth of which in the rivers wariss from 2 to 6 feet, while on the lower sections of the larger rivers the depth becomes from 8 to 10 feet. The depths of the canalised rivers are from 2.8 to 7.5 feet, and of the cana's from 4 to 10 feet, from 4 to 6 feet being the most common Comparing these figures with those of the Mustasippi, we find that, swen in the Ion-water messon, boats of 25 to 80 feet frast may be sent from the Gulf of Mexico 370 miles to New Orleans, Baton the Gulf of Mexico 370 miles to New Orleans, Baton the Superior of travel \$40 miles farther to Caire, those of \$-foot draft may pass from Caire 183 miles to \$81. Louis; while those drawing 4½ feet may pass up the Minesetopi, illinois River, and illinois State canals, a further dis-tance of 385 miles to Chicago The Ohlo has a depth of \$ feet from Caire to Pittsburg, a distance of 1000

Now, since the Mississippi and its tributario even, since use anississippi and its tributaries activated injectional title a better waterway system than any in Europe, the question is asked, Why is the river and canal traffic in Surops growing faster than the railroad traffic, while in the United States railroad traffic. is rapidly increasing, and river and canal traffic falling off? One important reason is that both the municipal and private interests in Europe have provided the waterways with good terminals, and boats and barges have been developed which are specially adapted to river and canal traffic. Here, practically nothing of the

river and canal traffic. How, practically nothing of the kind has been done

As an offset to these conditions, the sovectes of larger waterway development are in favor of the con-struction of much desper waterways than any in wealth of the contraction of the contraction of much desper waterways than any in weeks to pass at through. When the government inwesti-gated this subject for the State of New York, the co-clusion was reached that the cost of transporting grain by the typical lake freighter on a deep-water canal would be 38 per cent greater than by a towboot canal would be 38 per cent greater than hy a towboat and barges on a barge canal, and it was this conclu-sion that led the State of New York to abandon tha idea of a 20-foot canal

Our contemporary is of the opinion that it would be

the very height of folip for the government of the the very neight of fully for the government of the United States, under present transportation and com-mercial conditions to spend hundreds of militons on the davelopment of inland waterways believing that the development of initials warrawys Deleving that the only way by which considerable commerce could be diverted to the present or proposed waterways would be to compel the competing railroads to raise their cristing rates on low-grade commodities and re-frain from making reductions in France the governent compels the rallways to keep their rates at i ment compress the relivarys to keep their rates at least 20 per cent higher than the rates on the competing wateranys, this practice according to the report of the Royal Commission, being based on the opinion that waterways, because of the longer duration of transport, are not abla to compets at equal rates with

OGNOTIC PRESSURE AND CURRENTS.

T is known that a current can be generated by forcing a liquid through a porcus diaphragm or filter, but such currents were too small to be of practical value. The matter has been taken up by a German scientist B Schwerin He claims to have obtained remarkable results in current prodution A liquid circulates in a tube of large diameter and at a high pressure inside the tube is placed a and at a high pressure Inside the tube Is placed a filter through which the liquid passes, constituting of a certain thickness of a porous substance contained be-tween two sheets of wire gause. The current is taken from each of the absets by a wire. To produce a cur-rent we must have the proper liquid and the filter must be specially made. Adding suitable sails to water we find a high value for the current At the must be specially much Acting attracted saint in case as many time the disubirsam much Actine among time the disubirsam much actine and must also many time the above as a function, so as to reduce the size of the poper A san example he uses a presence of 5 atmospheres for the liquid, and a layer of 100c/ prowdered carbon v, jine thick with a nursice of 32 equare laches, the internal resistance being 1000 ohms when detailled water is used But as small current is now produced, but when we add ammonia current is now produced, but when we add ammonia to the water the current is increased int times and tha electromotive force twice, therefore we have 30 times the esserty by using ammonia. The best reamonia the best reamonia the best reamonia to the best reamonia the best reamonia to the best reamonia to the best reamonia the best reamonial to the same the first pressures we could obtain large currents. When the perseaures we could obtain large currents. When the perseaures we could obtain large currents. When the perseaures we could obtain large currents. When the energy is about the same. The liquid is best sent in a closed circuit of piping

MALLEY'S COMES

HALLEY CORRY

HE first observations of the coust in the morning sky show that it is disappointingly fail. Its intrinsic light has refrectly not increased as rapidly as in the case of some other course. On the case of some other course of the case of some other course. On the case of some other course, to will be far from conspicuous to the saked ope until the little roart of life, and those who with to see it the morning sky will do well to use field ginness, and to look for a much finisher older, with the less of all, than our front page filtutiration of last weak showed.

ENGINEERING.

The Fenney/wais Railroad last wook operated the first electric train through the tunnels under Manhait an island and the Size River. The train, made up of six construction cars and an electric locomotive, ran from the station in New York to the Thompson Avenue window in Sunnyaid yard, Long island City

As inspectant link in the proposed staturary from the Lakas to the Gulf must be eliminated from esteration of that scheme, at least for the present The section referred to is known as the illinois Fire Deep Waterway, for which it was proposed that the State should spend \$30,000,000, in the extension of the Chicago drainage canal down the valley of the Illinois River The bills proposing to proceed with the contraction were defeated in a special seasion of the Illinois Legislature, which adjourned bast month

The self-year of such as a substitute as uncorreptionally bear yearing in the reduction of the scoper hits in that city. This grading, which has a lways been going on intermittently, has recently been undertaken on an ambitious scale, and nnder the present scheme over corrects million cubic yeards have been removed When the plan is completed, the total will have reached thirty-four million cubic yeards have been reached they are the plan is completed, the total will have reached thirty-four million cubic yeards The work is being done by the hydraulir situlcing mothed, and the highest covers an axes of forcy three rity blocks.

The Great Western Radiusy in England is installing a compact ralivary licked printing machine. When a stoke for a certain station is required, the clork tourbes an indicator which carries the name of the station, slips a blank into a slot, turns a handin, and the completed ticket drops out. At the same time a record of the sale is printed on a continuous strip of the sale is printed on a continuous strip of the sale is printed on a continuous strip of the sale is printed on a continuous strip of the sale is printed on a continuous strip of the sale is printed on the sale is printed on the sale is printed on a continuous strip of paper and count his cash

It is well undervioed among naval men that the speed of a vessel is affected by the depth of the water not merely in shoal pieces, but in the depth of the ways. With a view to delurnining what effect different depths of water have on speed, the Board of in spection and Burey has arranged that the standard lastion trials of three weeds abidi he made over three destroyers "field" and "Plasser" will have their rivial destroyers "field" and "Plasser" will have their rivial over three measured rills courses, one at Rockland Mains, another at Cape Cod and the third in the

The Millet articulated compound lecomonitive rout thuses to grow in favor, the reports from its committee of this type which have been some time in earlier being in general very favorable. The New York Central system has recently put its first Mallet rompound in service on the Boaton A Malay line. The present claws of heavy freight engine on that road has a maximum tractive power of 26 tons, whereas the Mallet, when working compound, has 33 tons, and when working is supplied to fine tractive power. The encoses of this type in freight service is undesputed. What realist it will give in fart passenger service thom will tell. The operation of the powerful express Mallet on the Stants For ead will be watched with great indictions.

Advices from Washington state that the chief or Bernau or Navigation of the Navy, the aid for operations, and the sid for personnel, are mapping out another extended crusics for the Atlantic Sect. At present the scheme proposes a naval review at Hampson Roods, followed by the departure of sixton ships in four divisions for Gimalar, where the divisions will separate and visit the isolalite ports on the Mediterranean. It is possible, though not decided, that the contract of t

We are indebted to Mr Frank & Taylor for the description of the new dam with which it is proposed to replace the wavehold structure across the Colorado Eliver, which was carried structure across the Colorado Eliver, which was carried study at Colorado Eliver, which was carried study of reinforced concrete, will rise as free shows low water and extend for offsets the length. The portion of the old dam which was not carried away will be incorporated in the new structure. It will be supplemented by a velofrored concrete addition, which will raise its creek eleven feet higher than the old dam. To prevent the recurrence of the secopar through the featured rock, which was so disastrous to the old structure, cortain walls two feets thick are carried down thirty rice below water, and at the bottom of the trenches holes are drilled free the feet of the property of the post of the property of the second to suppose the superior of the property as guester lock, two sillest the crevious.

ELECTRICITY.

Emmin is becoming intervated in hydro-electric power plants, and he examining into the matter of electrifying suburban divisions of its since railroads An investigation is being made of our high tension transmission systems, and it is probable that a new field will be opened for American engineers

As alsocial lighting plant in Nobraska is manufacturing loss as a hyperduct. The exhaust steam of the plant, which would otherwise go to waste is utilized in the ammonia sheepstlen process of ice manufacture and also for distilling water from which the leim made. This westure, we are informed, has proved a very profitable one for the lighting rompany, and a very profitable one for the lighting rompany, and stituted of the salvantage by other plants similarly stituted.

A new system of treating eggs so as to prevent them from growing state when in cold storage has been discovered in Rochester This constan in subscitting the eggs to an electrical current. The theory is that eggs when pieced in storage are alley and are gradually frozen to death, whereas it the life is destroyed by an electrical current before they are placed to the constant of the constant of the constant of the lectron and the constant of the constant of the content of the constant of the constant of the content of the con-

In an address recently made by Prof. John W Whitehead of Johns Hopking University it was pointed eat that out of the 230,000 miles of railroad in this count of the 230,000 miles of railroad in this country, only a thousand miles have a prie been electrified. He called attention to the fact that the electrification of the observate railroads in New York related in teressing the capacity of the reads fifty per or To be serve, the questions of electrifying subtracts, express and freight service require separate consideration had Prof. Whitehead show that his case electrification to possible and dotten that his case electrification to possible and others that his case of the

PROPELLERS BRONZE OF THE EROSION

ONE EFFECT OF THE HIGH SPEED TURBINE

The introduction of high-speed turbine engines has produced a serious amount of crosion in propellers made of high tension bronzo—a material which until recently showed no serious crosion effects. The trouble which the bronze manufacturer has been chiefly occupied in preventing was corrosion both chemical and galvanic but crosion or the mechanical breaking and galvanic but resolve or the mechanical breaking up of the material by the article of the water, was formerly in we remaided. One of the most astonishin, cases of sever retrials occurred in the case of the Cunard liner Mauventails', for siter she had been in service about three months, on drydecking the ship it was found that all the brosse proposition were badly settle away, those at the storm being least were oanly eaten sway, those at the storm being west affected. The erea that suffered most was situated about two feet from the root and toward the after edge of the blade. The corroded area amounted to three or four square feet, and the metal had been eaten away in depths which varied from a quarter of

eaten away in deplus which varied from a quarter of au finch to two and a haif linches. A very thorough examination of the problem was made by Dr. Oswald Silberrad who, after an exhaus-tive series of laboratory and other experiments, detertive series or isocratory and orner experiments, occur-mined that the deterioration was due to crosion, and found that it could be prevented by the use of a special bronze alloy whose chemical and physical properties were designed specially to meet the condition

Dr Bilberrad came to the conclusion that since the material withatood the old conditions of propeller service, the primary cause of the deterioration was due to the modified conditions of higher propellor que to the modified conditions of higher propellor speed, etc. in discussing the new conditions he calls attention, first, to the terrific surface friction of the water The "Mauretania" was originally fitted with four three-hidded, hulli-up propellors, of the usual high tension bronse that has been employed for many high tension bronne that has been employed for many years for the propellers of Atlantic liners They were a little less than 17 feet in diamotor, and upon the westward vorage the average revolutions of the on stines were 174, the horse-power developed being about gines were 174, 10c norm-power developed being about \$8,000 The perimeter of each propolice trawside through the water in a holical path at a speed of about 105 miles per hour, and transmitted to the water dur-ing the whale of the vorgae no less than 17,000 horse-power "The consideration of these figures," says Dr rrad, "onables us to realise that, under s conditions, the water becomes a very rough fits for any alloy to withstand, and when the standard bronse, which has proved so serviceable in the past was sub-jected to these conditions, we can scarcely be surprised that it failed

prised that it failed."

A curious feature in the problem was the wide and
marked divergencies in the degree and position of
the deterioration in the various propellers examined
Thus in the sister ship 'Lustiania," where the condi-Trus in the stator snip 'Lustiania,' where the condi-tions were at first apparently identical, the backs of the propellers were quite as much affected as the faces Moreover, the propellars of certain destroyers showed a maximum damage at the base (see illustration) where the helical velocity is least. In lo ing for secondary causes, "dirt in the castings" v

excinded because the eroded castings proved to be exceptionally free from dirt. "galvanic action" also was shut out by the fact that analysis showed that no large concentration of copper had occurred on the eroded surface. At the same time the areas of m

eroded surface. At the same time the areas of maximum destronation do not coincide with the view that creation is alone the primary came, since these areas in no case occur at the extreme tips of the blades, where the helical volority is greatest.

After a prolonged research, involving the eramination of a large number of case of propeller destraints, it was proved that the trouble was primarity creation, although the degree to which secondary causes entered into the problem varied more widely than was anticipated.

In a series of tests to determine the relative regis

One of the new solid propellers of the "Maureiania." of special turbine alloy, which fall to abow any erosion.

tance to createn of a large number of different alloys it was found that the number of hours necessary to produce a certain deterioration varied from \$4.700 hours, the time of the regular standard bronse, to 117,300 hours for Parsons new turbine alloy, which was used to cast the new four-bladed, solid propellers with which the "Mauretania" and "Lusitania" have with which the "Mauretania" and "Lustiania" have been equipped. An examination of these propoliers, each of which weight shout twenty tons, was made after they had been running for nearly six months, by the surveyor for Gornanisecher Lloyd, who reported that be found from in perfect condition It is sig-nificant, also, that since their adoption for the for-ward, or wine abetic seek of these skips added about As the same four-bladed propellers are to be fitted to the other two antern shafts it is likely that the transatiantic speed may be raised this summer above the 20.06 average at which it now stands.

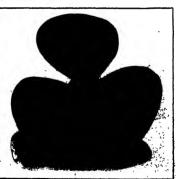

It was in 1850 that Mr. Hind read a paper before th amination of Gliefs oracibility. He discovered that his account of another comes in 1844 was so controlletory that he had no heettation whatever in preterring the Chinese statement for 1801, and concluded that the comes or 1801 was Halley's. He believed that the preceding return of the conest was in 1234, when, in July, shortly before the death of Philip Augustus, a comes was sen for eight days in the sevening willight. The Chinese annual on not mention this comes, but they Chinese annies and the revening twingst. The Chinese annies do not mention this come, but they mention comets in the years 1233 and 1234, neither of which Hind thought closely resemble Halier's Comet, Coweil and Crommelin have shown that Hind was varing about the particularly bright comet of 1251, which was unquestionably Hinley-friend to 1251, which was unquestionably Hinley-friend to 1251, which was unquestionably Hillory-friend to 1251, which was unquestionably Hillory-friend to 1251, which was unquestionably Hillory-friend to 1251, which was the particular to 1251, which was the particular to 1251, which was the same than 12

A new type of bosonactive designed to secure smokless combastion of bitumbous coal has recently been tided on two or three of the relayers entering China. The apparatus is designed to operate one the oclaims and the apparatus is designed to operate one the oclaims per an examination of the coal is so bed as to admit of the same being first consumed, those the bine finds to form mapid and incomplete combustion. Within the grates and consumed without the black smooth cutting, to sait a time if desired, from which the coal is a magazine which may be changed in coalities, to sait a time if desired, from which the coal is automatically feel to the first. A retary has underweath the first-box affords a supply of fresh air two seases through the tubes, and supplies the necessary draught. THE REPROSCUPS AS FOOD DETROTIVE.

seed oit, and such substances as burnt sugar Cayet peoper, actile other, tounin, crude cream of tartar. and French plum inter are frequently imported into broady and whisky

The term 'adulteration' when applied to food of drugs is broad in its scope, but has been given s drugs is broad in its scope, but has been given s well defined legal unaning in squreal it may be said that adulteration consists in injuriously subtracting from a substance any part of its natural or inherent qualities or adding to it any ingredient which would render the article of a different nature than that of its expressed

ful country, and seemlogly as a part of the flerce hust ness competition which hes institiously developed, this evil of food and drug adulteration has arisen. The conditions of substitution and adulteration of foods and drugs were little short of deplorable less than a and drugs were little snort or deploration feet than a detaile ago. For seventeen long years the bill which lias now become the Pure Food Law lay at the door of Congress and during all that time it was hitterly opposed by the mnufacturers who had so long onlyed unmolested their privilege of supplying the dinner ables of the nation with impure foods misles

While this not has done much good there is still a very considerable amount of adultration practised Preper adulteration is still remarkably common and "Pure White Giver Huney is cannot ted by the ind-sains of the lowy bee from glucose Other enterpris-ing manufactures will cause two grains of Cryenian peoper to grow where only one grew before by making on of the grains grow out of sawdust fround pass and beans may be found in black proper, and colory seed may be distincted with forty per cent of pow

In order to run down one class of feed faking, the od experts at Washington have introduced the pure-food experts at Washington have introduced the microscope into their work it can be readily under stood how gross adulteration may be detected by a sim pio microwope, as for instance when foreign seeds gravel, or powdered rock have been mixed with whole small spices. The adulterant may be of such a char acter as to escape the notice of the ordinary buyer, though with oven a small lens or reading gias eign aubstance may be seen to be very different from

fulness of the simple magnificr in examining food and drug mnierials, however is of little value for the examination of products which are made up of small particles such as flour, ground spices and pow In such cases r rourse must be had to the compound microscope with a magnifying power ranging from fifty to four hundred diameters

The world a supply of starch comes for the most part from a limited number of plants, twelve or fifteen part from a limited number of plants, twolve or netwer imited nearly all that are of much commercial im-portance. To the naked eye these starches all appear-as n fine white powder, but under a mit rescope grains or granules are seen which vary more or less in shape size rings nucleus and netion toward polarized light. Some of the grains are almost spherical, others are Boule of the grains are aimost, specical, others are unguith or ovoid and still others are very trregular in oulline in diameter they vary from one-tenth to one-thousandth of a millimeter. In no variety are all the starch grains of one size, but usually there are fairly well-defined limits. The way in which they sometimes vary will be seen by reference to the photographs re-produced in this srticle. Most of the grains show, more or less clearly fine lines of rings upon the surin some varieties these are arranged concentri

cally, while in others they are eccentric

"A hitem (uncleus) whose form and position varies
widely is certain species commonly occurs in starches,"
says B J Howard, who has charge of this unicroscopi work in the Bureau of Chemistry at Washingto "In some it is at the center as in corn and wheat starches, in others near one end, as in potato and ar-rowroot. When viewed in polarized light starches ahow more or less strongly a cross with the bars pass-ing through the hilum. Wheat starch has a central cross while in nuranta it is eccentric and well defined Beau starch which illustrates the leguminous type, has a spindle-shaped cross in the oat a number of starch granules are joined together forming a mass starch granules are joined together forming a mass When these masses of starch are examined under po-larized light individual grains in the mass have their own individual effect, and interfere so with each other that there results little more than a hazy glow of

By becoming familiar with these charac is possible to identify with considerable accuracy nearly all of the commercial starches Potato starch adulterated with ours starch wheat with cars flour and buckwhoat with wheat are examples of those most easily detected. One of our photographs shows a picture of points starch adulterated with a consider-able amount of corn starch. The grains of the latter are easily distinguished by their angular form

are easily distinguished by their angular form Another interesting application of the microscopic method of food analysis is found in the examination of spices. Many of these naturally vary so widely as to ash, fiber, etc., and in taste that it is impossible to

identify certain kinds of adulteration by chemical and physical means alone. A study of the structure of pure physical means alone. A study of the structure samules will usually fit the analyst to detect a tion in the ground spices as well as to identify the adulterant used. In order to work most intelligently, however it is imperative that the analyst should have however it is imperative that the analyst should have a good foundation in histological botany, since in this class of products the plant cell in its various modifica-tions becomes the means of identification. In an exam-imation of this sort nearly all kinds of plant tissue are to be considered, because some spices are derived from roots, as ginger, some from barks, as cassis and cinnsmon, some from flowers, as cloves, some from seeds, as mustard, some from fruits, as red pepper, black pepper, etc., and some, such as sage and thyme, from

"Unfortunately." says Mr Howard, "most of the substitutions used for adulteration have a structure very different from the ganuine spices For example, ough pepper may be adulterated with ground 1 or beans, it may not always be detected by che or orans, it may not arways be discored by commical means, especially when oflive pits or pepper shells have been added to counteract accessive starch present in beans A microscopical examination will reveal such adulteration at once by showing the presence of the large starch grains characteristic of certain legumes. In pepper the starch is present in angular masses made up of small grains."

It sometimes occurs that a manufacturer has added so large an amount of corn meal or foreign grou sholls and fruit stones to a popper as to make the adulteration apparent to the taste by the lack of pungency, which is often corrected by adding a small pungency, which is often corrected by adding a small amount of Cayenne paper A cophitation of this kind can be readily described by the microx opin embods of analyzis, became the tissues added are so distinctly different from normal pepper tissue I no need our photographs is abown the microscopic appearance of a sample of papper which was growly adulterated with recund cities tomes Tan starteny material has been stained black in the picture, while the party clear por-tions, more or less oblined is form, are the stone cells of the olive pits

The applicum fruits are readily identified by means of certain cells found on the inner portion of the peri-carp (pod) and others on the seed coats. These cells have characteristic ainuous outlines which make them casy to detect oven when present in vary amnii

numbers.
In offee and chorolate preparations reasted chicory,
cereals, and peas in the case of the former and starchy
materials and cocca shells in the case of the latter,
are sometimes used for adulteration. Coffee, being
the need of a gittant has a structure which is vary difforent from chicory, which is a root. The coil walls of
offee have a characteristic beaded appearance which
is present in but few other seeds. Even after reasting
and gridding theme bands can be easily distinguished while chicory contains san vessels by which it can be

Chocolate and curos are made from the seeds of the Checolate and excea are made from the seeds of the cocea plant, to which foreign starrhes are sometimes added Cocea beans contain naturally a considerable amount of starch. The grains are small in size and are easily distinguished from the starchy adulterants, are easily distinguished from the stareby adulternatic, such as corn and wheat flours or potato cera, and a rewroot starebse. An artificial checkenic coating has corn stareb. See failing and some mineral mitter, probably used as a coloring substance in the production of artificial yieldes as an assume which are considered as a coloring substance in the production of artificial yields jams, and some kinds of confections various thickeners are used among which might be sentimed golatin, starch, again-

agar gum tragacanth, and gum arabic. Some of these are difficult of identification, while others can readily be detected. Agar-agar is a product made from cer tain seaweeds, and usually contains the siliceous shelis tain seaw-seds, and usualty contains the sillivous abelia to dilations. These abelia are characteristic and quite neathy detected in the sediment from the bottom of a dish after the material has been digested with dilute nitric acid. One of our photographs shows such a distin-mencous shell tookined from a sample of artifact 'lamon sitcse' in which was found that the jellying metrial was agart-agar

Starrh can easily be detected by microchemical and microscopical tests. Gum trageaunth and some attergums of this class contain a certain amount of small starch grains. Were allowed to swell in water, a delicate imminated structure is developed by which these gums are disclosed even in such products as for even and marmaiades.

A sample of thickness for cream composed of corn starch and powdered gum trageaunth is above herein. Starch can easily be detected by microchemical and

and illustrates this feature quite extinuetorily. In this case the corn starch is shown plainly as the angular particles, while the striated bodies near the center of parties, while the striated bodies near the center of the field are swellen represents of the gum. The inter-scope is also of service in the examination of certain colles ints. Thus, if your land is dissorted in other and the latter is allowed to evaporate slowly under proper conditions, crystals of the lard Will be formed. These, if normal, will appear under the microscope as morrow plates with chiled-langual engla. Best fast treated in a similar tenance will normally crystalians out in sheaf-like turis of crystals, the ends of which are nearly or quite stoodie-like
Another application of microscopic analysis is in the

Aren, at mice

Abother apprexates or microscopic analyzas is mid-dientification of the flower from which housy is made. This is of practical value in the analysis of housy supporting to be from certain flowers. Although bees will almost invariably gather housy from sevaral kinds of flowers, sometimes one or another of these predom-inate to such an axiont as to impart a distinctive color and taste, cough to allow the honey to be called by that name By microscopic examination it is readily ascertained whether a so-called apple-blossom honey or an orange-blossom honey is really largely derived from the source claimed A photograph abowing sereral kinds of pollen found in an ordinary samp honey is reproduced

Correspondence.

THE IMPOUNTAGE OF THE BLAVES BY AND To the Editor of the SCHENTIPL AMERICAN

must file a demurrer to an impre I must file a demurrer to an impression created by the illustrated article which appeared in your issue of the 9th inst, under the heading "Ringing Chinese by Perforated Music Sheeta." In referring to Jehn McTammany as one of the inventors of the playero, I think an erroneous impress

veyed regarding McTammany's true relation to the development of the player

As a matter of fact, he is known and conceded to be As a matter of fact, he is known and conceded to be the father of the player by everyone in the plann trade familiar with the player history, and his claims to its inventorship stand unchallenged up to this moment. We do not refer to McCormick as one of the inventors of the reaper or to Howe as one of the invontors of the sewing machina nor to Cristofori as one of the inventors of the plane, although other men besides those mentioned contributed greatly to the development and improvement of the aforesid inventions

improvement of the acrossals inventions.

The listory of away great invention has demonstrated that some one man has stood out pre-eminently from all his fellows in the course of its development, and the pinyer has been no exception, and the one man who above all others stands forth pre-eminent in the player field is John McTammany, white around and about him, like so many satellites, have stood other men who have contributed of their gentus to develop and improve the invention. In the case of the reaper and improve the invention in the case of the reaper it was Mit'ormick who overshadowed all bis contem-poraries, on the other hand Howe was the presiding genius who led the sewingemechin piencers, while Cristofori was the pre-eminent genius who first con-celled and developed the plane it is true that others have improved upon the hand

work of McCormick and Howe as well as upon that of Cristofori, but nobody has been able to oliminate the elements which they introduced into their respective inventions, and so long as those essential sisments remain in their respective devices, just so long those remain in their respective services, just so long those interestings shall be attributed to the men we have mentioned. But the piano invented by Cristofori was mute and silent piano, and such it remained from the time it was invented, in 1709, until 1876, whon John McTammany breathed within its wooden walls the breath of life, and henceforth it became a living. breathing, yes, simest a human thing, until to-day it atsude forth the unsurpassed and unchallenged king stands forth the unsurpassed and unchallenged of musical instruments. The following definition the player has been accepted by the plane trade as

authoritative Thispress a smokel histranorit consisting of a easing two orbits and a service of easing the control of the cont

serverse...

The first man to embedy the foregoing sinemate for musical interness was John McYammany, and it follows that, if McCornick is the inventor of the reaper, Howe of the sewing machine, and Cristoferi of the spiral, and the serverse of the first to embody in their respective devices the essential elements which distinguished those inventous towards and the similaration of which would make them worked and the similaration of which would make them worked to the serverse of the serve Now the first man to embody the foregoing elame se carry as lars, as many year and described by the press of the country at the time, while your own files will show that Mun & Co applied for a pastent on this identical invention on behalf of McTammany on Sep-tember 7th of the same year, and prior to that nothing in the nature of the present player was known to the Patent Office or the public, either of this country or Mulicam N. Truss,

THE SOLAR AND LUNAR ECLIPSES IN MAY, 1910

BY FREDERIC R. HONEY, TRINITY COLLEGE

An examination of some of the conditions which govers the moon's motion reveals the great compless try of the inner problem. While the earth's values is nearly fifty times the moon's volume, its weight is more than eighty times—the density of the moon being only six-tenths that of the sarth. As a consequence, the common center of gravity of the two bodies is within the earth at a distance of over a thousand miles from its sur-face, and it is this point which moves in an elliptic orbit around the sun. Twice each month the earth and the moon exchange places with reference to the sun. The moon's orbit is an ellipse with the earth at one focus, and the plane of the orbit is inclined at an angle of a little over five degrees to the ecilptic. The ec-centricity is one-eighteenth, but the elliptic form is subject to great variations. The moon re-volves around the earth at an average velocity of a

volves around the earth at an average velocity of a little over five-eighths of a mile a second, but its path in space is the resultant of its motion in its orbit and of the earth's motion at a velocity of eighteen and five-tenths miles a second, illus-trated at Fig 1 The arrows A and a represent the velocities of the earth and the moon in their respective orbits. When the moon is at M, between the earth and the aun, the direction of the moon's motion is opposite that of the earth At M' the earth and the earth At M' the earth and the moon are moving in the same di rection. At these points and at any intermediate point M" or M" the moon's path is the resultant of the two motions. The plane of the moon's orbit rotates slowly tn a direction contrary to her bital motion, and the perigen has

a allow motion in the same direc-tion as that of the moon While the conditions which detormine the moon's pain are com plex, observations extending over plex, observations extending over iong periods of time show regu-larity in the recurrence of eclipses. (See Scientific American, September 12th, 1908) The direction of the line of nodes is shown in the plot of the earth's orbit for November 1909 at the date of the last lunar cilipse, and also in the plot for May 1910 During the interval this line rodegrees If the positions of the

and lunar or linees in May be exceeded plotted, and the orbit magnified, the situation of the moon relalive to the ecliptic may be determined by an inspection of the plot The arrow A shows the direction of rotation of the orbit, and a that of the moon's

At the date of the solar eclipse (May 8 7 d) the p At the date of the solar x-lipse (May \$7.6) the moon's rolliur many projected on the plane of the octipute in the scattle orbit radius, and the moon's position in that part of the orbit which is below the octipute. This is shown more clearly in Fig 2, in which the orbit is magnified one bunded and sixty tinus. The moon's position is shown at Orecuvich moon from May int to the 20th, and also at the dates of the eclipses. On May 8.7 d, the date of the total ordinary of the sum, the moon will be a wind-privile to target and the sum of the sum, the moon will be a wind-privile to ratched proaching the ascending node N which will be reached between the 9th and the 10th The enlarged plot shows clearly that the moon will be below the cellptic its shadow will therefore be projected on the south-ern hemisphere The path of totality will be between sarhing the ascending node N which will be reached ween the 9th and the 16th. The enlarged plot its shadow will therefore be projected on the sounren hemispher. The path of teality will be between
latitudes 40 and 70 degrees south, and as a partial
scipes it will be viable in Australia, New Guinea,
and Java. On May 1274 d the moon will be below
the ecliptic, and will partialize the ecliptic and will be present to the state of the ecliptic and will partialize of the eclipse will be
viable in portions of Africa, southwest Emprey, North
America except, Alaka, South America, and the southerr Pacific Ocean, the ending visible in South America
and southern Pacific Ocean.

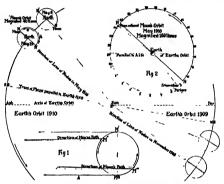

In Figs. 2 and 4 a portion of the earth's orbit in
May and the moon's orbit are drawn to the same
side, showing the projection on the plane of the south
into the ecliptic of the south of th

for each date in Fig. 2, and the curve is traced through the positions of the moon. The orbit of the moon at the date of the solar college is also shown. In the

The Fast Hall of the Pature.

The principle of a mechanical delivery of mail has ten established by the highly successful use of the neumatic tube. This device is not the least conspicu

cities, and probably will be applied to a greatly ramified postal enterprise in the near future. The chief question that arises in consequence is whether a system of delivery similar to that of the pneumatic

tube can be installed for greater distances and at the same time afford an enlarged rate of speed At the present day pneumatic postal de-livery is found only in the large cities, and be-ing restricted to local business, asks a rather exorbitant price for such service. It is plain that the employment of such a mode of distrithat the employment of sun h a mode of distri-bution to distant points consequently among the titles also must give a whelly new seper-to the present systems of commercial inter-course. The first attempts made for the devi-oyment of tills lifes were those of a company formed in Paris. A recent number of Der trottochiache Anneiger states unituately the techni-

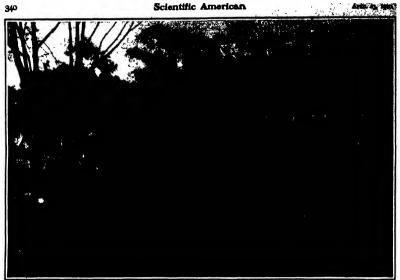

cal formation and other praces minutely the feeding cal formation and other progress of this enterprise which has reached the stage of thorough practicality, the result of the quite faths function of the experimental line in use 'but he near future the Paris com-

pany intends to connect the larger cities of France through relettic postal routes that shall not have frequent intermediate stations. The rate of speed pro-posed is 250 km (155 miles) an hony. The especity of the autohour The especity of the auto ni (25 cm yds) approximately and the weight of a load consist ing of letters and other postal pleres of smaller dimensions shall not exceed 100 pounds

The roadied so to speak, on which such delivery shall be pracwhich such delivery shall be grantled delinitely from all other means of physical rounnendstion must be lancer sellite to the means of physical rounnendstion must be lancer sellite to the control only either through no relevated road or through a union only either through an endown the control only either through a union of the control only either through a control of the contro (ross-section measures 8 sq m (95 sq yds.) For the round trip beginning at intermediate trip beginning at intermediate stations branches and switches are provided. The function of the experimental road, procured through an electric circuit, is such that the highest speed is The cars have two wheels which

reached very quickly. The cars have two wheels which run on the lower rail and size two rollers which fol run on the lower rull and sho two rollers which for low the upper rull and hold the area in position. The cars, moreover have a middle compartment for malt, and other divideous for the motors and the device used as brakes in grout and behind the body of the ears is a concles joint to diminish the reasons of the art. The frame of the tars is of tree with left. The motors are attrobed to the frame by most of kyons which awing around an axis perpendicular to the district of the state of the conclusion. to the direction of travel. The current is applied through an upper conduit and the brakes are worked through an upper conduit and the brakes are sorted by compressed air as will as by the relations of the air artificially increased by the wines attached to the sides of the front end of the cars. These wines stretch out to catch the air. This device can stop a cer within one minute and in a distance of three kilometers after the current is interrupted but is used only as an acory to prevent the too rapid destruction of wh and rails through the exclusive use of the rail brake, ource of most active friction

A patent recently granted to Carl Farkas of New A patent recently granted to ("eri Pirchas of Now York, describes a method for making incustionesett lamp metallit filaments which robolists in producing on a conducting core a highly refractory realing by decomposing in a vacuum the vapour of a sail of a highly refractory metal in the presence of vapour or yroughl, with final refuction in a vapor of hydrogen in detail, the vapours of tailorfed of chronium and pryn-gall are introduced in a vacuum containing the con-ductor, which serves as a core which latter is then heated by the passage of a current the vapors are thereby decomposed, nament carbon from the pyrugali acting as a cement thromium probably being formed When the conting has thus been produced the vapors are removed and hydrogen gas introduced, whereby the deposition is reduced to metal

Some of the little craft that competed in the racing.

MODEL MOTOR-BOAT RACING

BY H. D. JONES

Model motor-boat racing, a new sport, has caught the popular fauty in England, and is being taken up in all the large titles. With a view to encouraging owners of models to enter their boats in the various competitions, challenge cups are offered by the clubs, and the conditions are made so broad that every de signer feels that there is a chance to win a trophy signer recis that there is a chance to win a troppy The prizes are awarded for speed, for workmanship, for the general supearance of the models, for the behavior of the machinery and the performance of the beats while on the water

Not less than 5,000 spectators gathered recently at Not is than 5,000 spectators gathered recently at Chaphan Common, one of the many open paces in South Lundon, to witness the regats on the lake The competition brought to the front some of the specifiest racing models, some particularly fine one of saleon steamers, linera, and torpedo boats, and other raft that were built for appearance rather than for rating

The rules of racing were very simple Each owner started his model boat to run a straight line over the course at the end of which officials appointed for the purpose waited to "catch" the racers and return them purpose waited to "catch" the racers and return them to fish rowers. After the models were once started no interference was permitted, the ability of the unguited boat to keep in a line for the finish of the curse being part of the qualifications for prise win

Over a course measuring fifty-one yards, four bosts Over a course measuring fitty-one yards, four boosts were started in the first race, at which the accompanying pictures were taken. The best time was made by a stoum hydroplane, the "Foliy," in § 1.5 seconds, "Sunny Jim 'a gazoline eraft, did the distance in 12 bis evends, "Ladd NY," a stamer, covered it in 15 4.5 seconds, and the fourth steamer, "Idunno," in 2 seconds. in 2t seconds

in 21 seconds
On running off the final heat, boat against boat in
noirs the 'Bunny Jim' accred three wins, the "Leda
IV two whis and the "idunno" one win thus taking
first second and third prizes in the order named The prizes were allow cups. The "Folly," the fastest beat in the climbating tries, antorinately ran off, her course in the finals through her propeller fouling, and not being able to get going in the others, she had

to give her opponents a walk-over Steering troubles were responsible for many awk secretary trouves were responsible for many awar ward results in the offer races. While halled by the speciators as adding greatly to the enjoyment of the regatta, the failure of the little craft to keep their pointing and the parversity of the machinery when

left to its own resources proved sources of great disiert to its own resources proved sources or great dis-appointment to the owners of models that falled to keep a truo beadway Boats that had run as true as a die on practice spins_axhibited a tendency at the regatta to run anything hut straight, or not to run at all Gasoline motors refused to start, pumps gave ont, bollers leaked and the models exhibited a cranki ness that showed there is a lot of improvement necessary before this sport can be brought to perfection but that is why the regultas are encouraged. The weak points of the models are strengthened, and motor-boat building is benefited as the result of the lessons learned from the eccentric performances of the models in the cup races.

the inodels in the cup races.

The reliability of electric power in model regattas
was demonstrated again and again, one finely-modeled
liner, the "Fairholme," although not built for speed, liner, the "Fairholme," although not built for speed, scoring through the certainty of her performance and the untrustworthness of some of her competitors. The surprise of the meeting was the performance of a finely modeled gasoline boat, the "Silver Dart" So a finity modeled gasoline boat, the "filter Dart" for fast was this entry, that the officials stationd to catch the models at the posts could not reach her when a little of the line, and alse swered sway. Heading off down the pond, the little boat cluded a second at tempt at seture, and before she finally came to hate she had completed two round trips in brilliant it some-what erratfol fashion, to the admiration of the spe-

what erratio fashion, to the admiration of the spec-tators.

The supediency of running the regating on a tire-lar instead of a straight course is also snagsfur the attention of the superix, the difficulty of handling that is a superior of the superior of the superior of the second of the superior of the straight run serons a small pond serious accidents seem navedshiet. One beautiful model, the "florwing. Ill" after secomplish-ing several fine sprints, stoded the catchers, deaded of on a course of her even, and wound up a serior of mischierous gyrations by running that the tasks of mischierous gyrations by running that the tasks the bank, seriorally damaging ber hall and devanded by a circle of catchers standing rear install be avoided by a circle of catchers standing rear install be avoided by a circle of catchers standing rear install be avoided by a circle of catchers standing rear install be avoided by a circle of catchers standing rear install bears platified thair existence by premarking improvement and bringing unknown designers and invarious of motor-bears and motor-boat machinery so the freet. Instead of pro-lain that the standard of the standard of the con-tendard of the standard of the standard of the con-tendard of the standard of the standard of the con-tendard of the standard of the s

parison with the work of other designers, a number of men with kindred ambitions are brought together in these challengs meetings, and the test of the new at a capabilities is thorough and convincing.

The sport has progressed so far that a national challenge cup is ready for the competing designers and model owners of the United Kingdom, and the various clubs are about to hold a general meeting to draw up rules for the government of the cup regattas Naval men are especially interested in the exhibitions. At the regatta, which was the subject of the accompanying pictures, Lieutenant William Barrett, R.N., attended with a party of naval cadets and rendered many services to the committee

et of \$0,000 Candle-Power Street Lighting Plant.

BY ALTUN D ADA

As tungsten lamps require only 56 per cent as much energy as the carbon type for equal illumination, they have greatly reduced the cost per candio-power of incandescent street lighting.

What can b. done with such lighting in a sm

rusas: con b. done with such injuring in a small town is littletated by the following costs and opera-ing expenses for a plant to generate and distribute tungsten street lamps of 30,000 candis-power total. Unlike the merely nominal rating of are lamps, which are a number of times their true candis-power,

the tungsten lamps are rated at their actual mean can dispower in horizontal directions.

dispower in horizontal directions.
The capacity of 50,000 condispower is selected as merrly satisful for street. Highting in many medium and small terms, societing to the dessity of illimination required. If lamps of 46 candispower are selected the capacity named amounts to 540, and with lamps of 50 candispower the 50,000 candispower capacity will operate 350, the elicitancy being the same in either contracts of the capacity parts of the capacity and the capacity and the capacity will be some in a either capacity will be capacity and the capacity of th

With 500 of the 40-andre lamps speed 100 feet apart, or 550 of the Streamle lamps 800 feet agree, 500 feet in length of streets may be lighted much below that in sumal jamps, while ordinary reulizs may be obtained by speed and the samp 200 feet apart or the 80-andre lamps 200 feet, or 15 miles, of streets. kildowatt heave, which into the annual

expense of \$6 200 gives 62 cents as bo

The Conlings Oil Bistriet, California. A report on the geology and oil to

the western part of Presso and Kings counties California by Raiph Arnold and Robert Anderson has just been pub-

Montarry 110 miles away with San Francisco Bay 200 miles away and with other points

The report describes the topography geology paleon slogy and oil in the Coalinga district which have been in part described in an earlier report published by the Survey but not now obtainable. The present report includes a more complete discussion of the district and many new maps actions and other filtus-trations besides a paper by Irving C Allen on the chemical and physical properties of the oils Man; interesting points in comection with the history of th interesting points in connection with the history of the region in past geologic ages are brought out and be means of careful descriptions of the formating a foundation is faid both for an accurate study of the occurrence of oil within this region and for the tracing of formations and oil horizons in other parts of Call

The report covers 564 pages and includes 52 plates and J text figures. The characteristic feedle of the locks of the region are fully illustrated. These afford a means of identifying particular strata from place to

same of identifying particular strate from place to c and of determining the depth and position of the oil bearing sands. Its discussions of the oil rones of the factors affecting the accumulation and the gravity of the oil of the relations of oil and water and of the origin of the oil are of broad general interest. The maps and diagrams and the wells and the character of their various products are of decidedly practical immediate value

He was at an estimated height of 900 feet when his pro-peller broke and flew off. Quickly stopping his motor, Leblanc skillfully glided to earth amid the cheers of the --

The Assess of Messas Rakinsky,
Three months ago, a party headed by Thomas Lioyd
for Fairlanks, Alaska, for the purpose of climbing
Mount McKinley The gaumnit was reached on April
374, after a mount of pressyd (minhig) a comparacatallished at the base of the peak in March. The
companions of Thomas Lioyd were W R. Taylor,
Charles McGonigie, and Daniel Petterson Six other
men ware also included in the party, but they cove
lett in care of the four camps established on the way
toward the top of the peak. Up to 11,000 feet the asscent was easy, but the next 4,000 feet were climbed
only by having steps out of solid fee When the 18,
600-foot leval was reached, a final push was made by
the four men named, with success. The acpedition the four men named, with success. The expedition had its inception in the violent controversy which and in inception in the violent controvery which raged whan Dr. Cook was lecturing. To sattle the point whether or not he wer climbed the mountain, and to prove that it could be done, an expedition was financed by August Peterson and William McPhee.

No trace of Dr Cook's ascent could be found on eithar of the two peaks which countitute Mount McKinley No records of his were discovered

Various estimates hava seu made of the moun tain's height. Dickey, an American prospertor, estimated it at 20. pector, estimated it at 20,-000 feet, and gave the peak its present name. Robert Dunn, who made four attempts to climb the peak, estimated its height at 20,300 feet.

Inasmuch as the present party was not properly equipped to measure the height of the mountain, its achievement is not of nuch scientific value Fortunately Prof. Her-schel C Parker of Columhia University has ex-pressed his intention of climbing the peak regard-iess of Lloyd's success. Dr Parker will approach the peak from the south-orn side, and will study the glacier and various phenomena. He will take with him scientific in ments, by the skillful use

which undoubtedly ined than could be secured by a party of four unscientific but hardy explorers.

Barril, the guide who exposed Cook, is inclined to dispute Lloyd's claim

A New Way of Lighting Mar

A New Way of Alghitug reages.

A new system of electric lighting for theater somes was tried not long since at the Imperial Opers of Berlin, and, it is attack with great aucoses. It is the investion of the Spanish engineer, Forting, and uses any lamp as the source of light. The rays of the lamp, instead of falling directly on the seens, are thrown against a series of silk bands which are un rolling and set in any contion by measure of pulsars. The series of the lamp in the content of the content The cannot serve to renect the light and change it into a perfectly diffused light. The new method also in-cludes a sky which is formed in a quarter of a sphere and composed of a steel cap which is treated with a dead white coating. The diffused light is sept into this dead white ceating. The diffused light is sent into this dome and give the Illustion of an unlimited space. Another interesting device is used to disposes with the confidency clouds which always have a rigid apparatum to the audience. These now appear to be quite plastic and mobils. Such rient is secured by the use of mirrors which reliect painted services representing the clouds. When the mirrors are rotated always, the choice appear to stowed from tore or rotated always, the choice appear to stowed from tore grant notion which was placed in the which we have the contrast of the complication of the column of t

An Automatic Projecting Lantern with Electrical Control BY JACQUES BOYER

Hitherto it has been necessary for a lecturer using lantern illustrations to employ an assistant to operate the lantern and insert each silde at the proper moment M Moulin has invented an automatic lantern (Fig. 1) which dispenses with the services of the assistant. which dispenses with the services of the assistance. The impulses mechanism which inserts and remote the sildes can be adapted to any projecting lanters and enables the iscturer, by pressing an electric state of the interest of the superiority services the teaches as is shown by Fig. 4. The pictures can be thrown on its shown by Fig. 4. The pictures can be thrown on the white wail of the class room, and if a powerful source of light is employed it will not be nocessary to darken the roots an extent sufficient to prevent the taking of notes or the use of the blackboard. The interest allows are the services of the contract of the class of the services of the servi

The lantern sildes are attached to a conveyor, com osed of two chains connected by grooved cross-bars, which pass over a skeleton drum, formed of two iron disks connected by six rods Each slide is firmly held between a fixed and a movable bar of the conveyor by

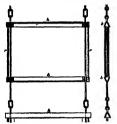

Fig 2.-Front and side views of chains carrying stide

the tension of the spring r (Fig 2). The drum is turned by a small electric motor, by means of a tau gent screw, and, as it rotates, the sildes are brought successively opposite the projecting lens

operation the flexible con voyor carrying the slides is taken up from a box behind the drum and delivered to receiving box beneath the

The motor is shunt wound, so that it can be reversed by reversing the reversed by reversing the current in the armature colls. In this way a slide which has already passed the iens can be brought back and projected again, if desired The electrical connections by means of connections by means of which the apparatus is controlled are shown diagram matically in Fig 3 Beneath the locture table is a switch I, the closure of which sends a current through the electric are A. of the projecting lantern, and also through the field cutis B of the motor, which are connected in parallel with the circuit containing the are and its rheostat On the table are two double s and s' ... ets of these connected born 1 and 1' are nor with one wire of the gen-eral circuit, the lower conand the fixed ends of the keys are connected, re-spectively, with the two sture H of the electric motor. Hence, when spetter key is depressed, both breaks are in connection with the same main wire, and no output flows

through the rotor R, which consequently, remains mo-tionless By pressing the key a, the current is sent tionless By pressing the key a, the current is sent through the retor circuit in the direction indicated by the arrows, and by rolessing a and depressing a' the current and the rotation of the motor are reversed. The incondescent lamps L and L' are bridged on the

Fig. 1 .-- An automatic projecting lantern.

keys to diminish sparking but they also serve another usoful purpose. When the key a is partially depressed, so that it does not touch either contact, the rotor circ cult is completed through the langu L, which greatly cult is completed through the langu L, which groutly increases the realistance of the cirruit, and the current flowing through the rotor is further diministration by more than one-half by the should offer to free lamp 1. Hence, the notor turns so slowly that it is an easy matter to atop the desired slide result by in front of the lens, by releasing the key a at the proper unsuff. Without the slide of the of the lens, by releasing the key a at the proper mo-ment. Veitier of these effects is produced when the ment. Nither of these effects is produced when the key of is fully depressed, because the lamp L is then short-circuited by the key and the resistance of the circuit is thus made so small that very little entrent is diverted through the other lamp. A slow more me at

of the motor and the alides in the reverse direction is similarly produced by partially depressing the key b

Tides of Beauty

The average time of high water at places on the Pa cific coast of the Central American isthmus is three hours after the moons meridian pass The average time of high water at Colon is six min-The average time of high water at Colon is six min-nies, and at Greytown one hour after the moon's mori-dian passage at Colon. In other words, as Colon and Panama are nearly on the same neridium, it may be saired that high tide will occur at the Patitic or Panama end of the Pausina Canal, on the average two hours and fifty-four infinites after high tide at the At lantle or Colon end, and high tide will occur at the Pacific or Brito and of the Maragus Canal route two hours after kigh tide at the Atlantic or Greytown end

The level of mean tide is practically the same at both ends of both of these isthmian canal routes, but at Panama the tide ranges from 10 feet above to 10 feet below mean sea level, while at Colon it only ranges from 6 or 8 inches above to 6 or 8 inches below

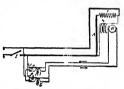

Fig 8.-Electric withing for antomotic projector.

mean sa level, and at Brito or San Juan del Sur the tide ranges in the extreme from 4 feet above to 5 feet below mean sea level, while at Greytown it ranges item than 5 Inches above and below meno sea level

than 's Inches above and below mene as a level.

Thus with a sealered canal built along either the
Nienracus or the Panama route, there would be
through currouts from the Pacific to the Atlantic at the times of high tides at the Pacific Lermini, and from

the Atlantic to the Pacific at the times of low tide at the Partie termini

In answer to the specifi question Assuming that the Pacific tide rises about 8 feet suppose II to be high tide at San Juan det Sur, Nicaragua, al noon stand ard time, what would be the approximate difference in level of the Atlantic at the same time say at Grey town Nieuragus*" it may lown Nierragus. It may be stated that at the lime of high tide at Sau Inau del Sur It is two Ionis after high tide at Grey town, and if the assumed rise of 8 feet in Sau Inau del Sur is above me on sea. level the difference in level between the two ends of the canal would in about 72

mation with reference the weather conditions Dr William Shaw Director of William Shaw Idex for di-the Meteorological Office of Great British, has been traveling in western Can-ada Wills reference to the alleged general changes in the elimate owing to the self-tement of the country. Dr Skaw is skeptical He that the people of all localities are under the impression that the climate of their district is undergoing a change. The similation do not however lane aut this idea There are oscilla-tions but no permanent changes in the climate

INSECT PESTS IN HOUSE AND STORE

HAROLD BASTIN

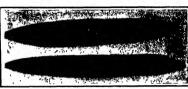

Insects as a class feed literally upon anything and veryfiling from which nourishment may be extracted everyining from which nourishment may be extracted by dut of strong jaws backed up by equally strong digestions. A substance may be bone dry, almost as hard as rock and in every way uninviting, yet so everything from which nour

iong as its origin is traccable to the animal or vigetable kingdom at least one in an probably very many kinds one in our probably very many kinds will and in it the wherewithal of evening. And because they are omnition in in the full sit seems of the word, in our rank as the worst peats with which civilized man has to contend whither his calling be that of a pro whether his calling be that of a pro-direct or a disseminator of the neces-surios and inxuries of life. Much has been written respecting the depreda-tions of insects. Everyone will prob-

tions of Insects Everyone will prob-sible know something at least of the tax-which has been imposed upon the ex-chequer of this country by such insects as the 'colorado beetle and the "scale" of the orange groves But it is with certain posts which while less devestating in their activities, affect closely the individual comfort of our readers that the writer proposes briefly to deal in this place. Probthe writer proposed orient to done in this piace. Probably few people realize what a number of insact peats are to be found in the ordinary house or larder. In secta penetrate the vary fabric or our dwelfing places—that is, so far as the woodwork is concerned. They burrow into our furniture and our books and con unic by slow degrees the very carpets on our floors and the clothing in our closets and presses

Among the most widely distributed of these domes Among the most widely distributed of these domes-tic posts are certain tup besting of the genus Anoltum Their ancestral home was in the woods and iance where they are still abundantly represented, frequent ing the doad branches of trees and shrubs. They have, however forced an entry into almost every old house in the land, as well as into many a modern described by both and a well as into many a modern described by boring into and consuming furniture, beams and woodwork in general. This successful assault of our houses must have been accomplished many conturies bouses must have been accumplished many centuries age, for one of the commonest species was divided 'dons sifess' by the old naturalists and is so called at the present of a This insect is barely one-sized of at inch in length, gray brown in color, cylindrical hape, with its head hidden in, or overbung by the thorax. The they grains are not-bodied, with hard brads and—as their work bears witness—powerful jaws It is not difficult to dotes the presence of these grubs in woodwork Suppose that you have a valuable Chippendale chair, and that you notice beneath it upon the floor, certain little heaps of yellowish dust insuction of the chair itself reveals minute holes

as though the piece of familiare had been "peppared" from a distance with a charge of dust-shot. These signs are indisputable evidence that your chair is the standard and unless by some means you can

contrive to dislodge the peats, they will slowly but surely reduce the woodwork to dust and chips When once a piece of furniture is assailed by Ano-bium, it is a very difficult matter to cradicate the peat. Several mothods have been suggested One plan is to place the piece of furniture in a refrigeration

Dust from the borings of the cork-caterpillar on

for a week or two, and thus attempt to kill the beetles and their grubs by cold. It is somewhat doubtful, however, whethor even this soreer ordeal will destroy all the beetles. Another way, and probably a more effectual one, is to place the furniture—first taking it to ploces if necessary—in a hot chamber or oven, and there bake it for twenty four hours or more

temperature be kept h little above that of Soffing water, not a single bestle will be alive when the Sub-lag is over. Often it would be impossible to addy either of these methods, and is such cases the best plan is first to place the piece of furniture in a very

o place the piece of turniture in a very het roum for some hours, these to in-ject, by means of a very fine-mose syrings, a perfonence light—such as crecoste or cyanife of potassium—fine as many of the tiny "norm beles" as can be found on the surthes. Then tr-move the furniture at once to a cold place, when the sudden change of ten-preture will cause the potenous femmes to be drawn into the innermost reholes on the surface should be st up with paraffin wax

PERSPROSE CONSTRUCTION AND OUR ANNUAL FIRE LOSS

It is esti d that our annual fire loss and the it is estimated that our annual are loss, and the sum expended for fire protection, etc., represent an annual sum that is approximately equal to the cost of building the Panema Canal The public is awakesing to the

nim16 cance of this fact, and business men and business men generally are bo-ginning to realise that the best way to guard themselves against the fire peril is, not so extinguishing fires and burden themseives with heavy insurance, as to so srect their buildings that it will be difficult for a seri ous fire to origi-nate, and, if it does, impossible

Applying the plaster to a rib-stiffened steel lath and pla

both the ribs and the fath being made from the same shoot of steel. The object of the ribs is to give suffi-cient stiffness and rigidity to the fath, so that when elent stiffness and rigidity to the min, so that were used in walls and partitions no atude, such as are required by the ordinary plain lath, will be neces-sary. When it is used as reinforcement for floor and mary When it is used as relatorcoment for floor and roof slabs, no wood centering or falsework in rougher for the ribs give the required different fitties and for partitions, it is morely necessary to provide a fastening at the floor and th necessary to provide a matering at the floor and the elling. The sheets are then sot in place and the daster applied directly to both sides. For sidings of factories and similar one and two-tory buildings, a framework of steel or concrete is

Daikling a roof of reinforced concrete construction.

FIRE-PROOF CONSTRUCTION

ous hold upon huliding The growth in favor of fireproof con the huliding struction has been indirectly stimulated by the growing price of lumber, the advance having been so great that for some forms of construction there is but little extra initial cost involved in putting up strictly firepro construction. Indeed, from an investment standpoint it can be demonstrated that the freprent hullding is the only really occumient building. The saving in the cost of insurance, reduction in depreciation

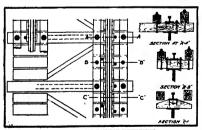

the cost of insurance, reduction in depreciation charges, the guarantee sensint interruption of business by fire, combine to make an unburrable building the cheapest in the long run.

The phenomenal development in reinforced concrete construction must be regarded as one of the most significant movements in the bread field of architecture and engineering It is not too much to claim that the item's abare of improvements in this direvilon is to be credited to American engineers. to be credited to American engineers. The experi-mental work on sample structural members, and este-cially upon beams and columns, has led to a pretty thorough knowledge of the irre principles of con-struction to be adopted for reinforced concrete when used in such members, and the introduction of a reinforcement designed to adequately take up the basering strains, as supplied for instance in the Kaila system, has made it possible to produce beams, gird ers, stringers, and other members subject to bending provided to which the sheets are attached. Lines of supports are provided, about six fret apart and the ity Rih is properly fastened to them. The framework is similar to that which would be provided where the ordinary wood sheathing or corrugated iron is used, except that the girts can be placed a greater distance apart. When the steel has been properly placed a special stucce plaster is applied in two roats Whore the system is used in connection with floors

and roofs, supports are ordinarily provided about five fast apart. The sheets are laid directly over the sup-ports with the lath face downward. All that is necessary to complete the work is to put in the controls on the upper sides of the sheets to the required list ness. Only a sufficient amount of rom rete will flow through to give a thorough clinch on the steel. This leaves a roughened surface on the underside, which provides a satisfactory key for the plaster applied on the relling below By use of reinforcing materials similar to this, nearly every type of bnilding no mut ter how small, may be built fireproof at a cost very little greater than the ordinary wood framing

IMPROVED BLEVATED BAILWAY CONSTRUCTION The combination cross tie and "block" in construc-tion shown in the accompanying drawing has for its object to reduce the noise of elevated railroads and

no of elevated railroads and increase the light to the atreet below. An open con-struction is provided yet the rails have an almost the rails have an almost continuous support white tends to absorb and step the vibration sent out from the rails. Bost of the noise from o train on an ok vated from o train on an un voca-structure is due to the pas-sage of the whoels over the rail joints and there is no doubt that this noise is sage of the where over two religions and there is no doubt that this noise is intended by the inefficient support of the rails at usels. Should the three blooms to be relied over the rail, the vibration of the resource of the inserting which is the support in the support is made the noise over the rail, the vibration of the resource of the inserting which is not support is made the noise is reduced to a maintain it is but natural for engineers on copy precedents, and for this reason the usual system of cross loss, which, by a process of ovolution, has been facilies.

· DEPROVED ELEVATED BAILWAY CONSTRUCTION

orth can be determined with de-

present, whose strength call be uncreased probable accretively.

Side by side with the development of reinforced concepts members, such as ore suitable to what night be called the thicketon frame of concrete britishing, anythology of the control of the bred open carriace represented by the secondary general control of the control of the force and the control of th

which, by a process of ovolution, has been found most satisfactory for a road constructed on the ground most existancery for a road constructed on the ground has been adopted for elevated railroads, with the result that an excessive amount of noise in produced when-ever a taxin passes over the rails, and the street is en-necessarily darkened by the multiplicity of cross the Talls proposed system of building an elevated railroad has been suggested by Mr Carl E. Kiek, of 1245 Colum-bla Avanas, Chicago, III.

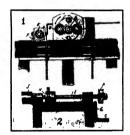

ATTACHMENT FOR WOODWORKING MACRISES.

The accompanying engraving illustrates an attach ment for woodworking machines generally known as mulders or stickers used in such and door factories for cutting rabbets and moldings in the parts to receive the panels. When a door is to be provided with a pane of glass, it is usually necessary to cut away the molding or rabbet at one side so that the glass can be inserted when the door is completed and be held in position in the usual manner by means of outty In r io avoid a second on ration to cut away the m ing for this nurpose the auxiliary entier shown in the accompanying cograving is provided. The auxil-lary cutter is arranged to be moved axially into and

ont of operative position, so that whom it is no longor desired to cut away lin molding the operation of the auxiliary cut ter can be stopped in Fig. 1, which shows a face view of the morbine the main shafi la shown at 4 and main head, provided with the coilers B which form the rabbet and mold ing immediately In front of the entter hend is a table on while it the

work is supported and a pair of guides D for holding the work in posi tion. The auxiliary cutter is mounted on a shaft F. It consists preferably of a square enter head provided with a pair of hisdes F. Fig. 2 shows a side view of auxiliary ruther moved to inoperative position so the authory there is mapped on the table that it is lears the work if supported on the table to.

The shart of the auxiliary entire is provided with a yoke and collar if by which it may be moved axially so as to bring the utter tuto engagement with the

SHAFT COUPLING

Pictured in the accompanying engraving is an improved coupling of the type adapted for connecting the abutting ends of two recombine shafts. Briefly the device consists of a key and o sie we which writes to hold the key in place white a second looking key serves to retain the slesse in position over the two shafts As shown more charge in pantion were the year.

Fig 2 and in Fig 5, a keyway is sut in each shaft and a pit ur revess is formed at the end of the keyway. The shafts are inread so that the two key and a pit tree to the second of the tree and second of the tree and second of the seco keyways Before hringing the shaffs together, a aircoid listed over one of them. This sleeve as shown in the cross-sectional view, Fig. 1 is formed with a keyway adapted to fit over the ky A when it is moved over the abutting ends of the shafts. To hotel the sleeve in position, the key D is used. This disthe severe in position, the key B is used. This his linto an exterior keyway in the sleeve C and is provided with a pair of lugs E which pass through the sleeve and into the two shafts. A serve F serves to hold the key B to the sleeve C in this maconer through the two shafts are rigidity connected. Owing to the large

diameter and massive construction of the sleevs O and owing to the manner in which the two keys are interiorked the coupling has a ser math qual to the of any portion of other shart. Who the shafts are coupled they are in 11 in alignm if with each and it is impossible to turn on shift relatively to the other as print a free sufficient to milled them to a considerable at m. A pant on this coupling has

EXECUT PRINTS 19, PROPER AND PRINTS. called "
continuous from some \$440,"
and the prints of the prin extremely sman area, and the sortness of its body, make it difficult to understand how this noise can be produced, but I give the fact on the authority of an emi-nent observer. Before leaving the borgive the fact on the authority of an emb-net observer. Before leaving the box, ing bestles of the genns Assolven men-tion should be made of the species known popularly as the hread or past bestle (A penticevan). It is very con-bestle (A penticevan). It is very con-nected by the control of the con-tantity," for it appears to set almost, another the control of the con-tantity," for it appears to set almost, anything which it ancounters, from dry wood to Carvenne pepper, although it seems especially to appreciate bread, his-cuits or other concections in which flours and water are the chief ingredients. It is often most destructive to the stored goods of merchants, as well as to the account of the control of the photographs here reproduced show samples (1) of mearcants and (3) gin-samples (1) of mearcants and (3) gin-

been rendered aimost worthloss in this manner while there is a case on record in which twenty-seven follo volumes, standing side by side, were perforated in a straight line by one Anobius grub or "book worm" Its tubne was so perfectly drilled that it was possible to pass a string from one end of it to the other, and thus lift up the entire set of twentyand that int a pice of the entry behavior of the entry of

ness of their heads and the strength of their however, their jaw muscle.

Probably faw poople, save those who dashed in natural history, are sware that the abbie in natural history, are sware that the abbie in natural history, are sware that the area to be the formed by wine meritance in the formed by the peritance in the control of a bestle known to science as fast-lars are affected by this peat, and its demonstrated for the formed by the peat and its demonstrated for the formed by the peat of their formed peats of the formed by the peat of their formed peats of the formed by the peat of their formed peats of the formed p resourced the traditional air-and-emi-light habits of moths in general, and to frequent by choice the glotom of subter-rison values, the property of the resource of the control of the location, and when the tiny calespillars backs they burrow into the substance of the cork, just as the exterpillar of the log goot moth berrow into the beart of an oak or an applic tree.

The presence of the wine-cork peet is fact may be displeasing to many. We if manifested its an accumulation of cork-ine were to avoid food or bewragas without and return ("frain") round the ex-ply because one doubted their present out and return ("frain") round the ex-ply because one doubted their present out of the cork. This as from contamination, by finesch, one cumulation may be seen in one of its world eat and strink very little induced ("policies heaveful Later, if the first by the contamination of the period is doubt if there is paid or present the contamination of the contamination

it may almost be described as a common object of the dessert table, for few figz, save the most recently imported, are quite free from the small white grubs of this moth. In passing, it may be remarked that this attack cocoa bear

attack cocoa beans,
But while the fig moth acc no small amount of damage, its depr tions are far less serious and w ind water are the chief ingredents. It is osman among damage, its depredations of merchants, as well as to the stood of merchants, as well as to the photographs here repredened above seek which come unbidden with the amples (1) of marceroni sod (1) gin-desert. I am able to reproduce a photograph in the first and the photograph here produced almost the restrictions as stock of boots and almost produced and the stood of the

When the gruh is full fed it bores its war out of the apple, and eventually spins a coroon of rough silk in a crevire in the tree trunk, or on a neighboring fence in which it changes to a nongaport of the spin silk in the
nutness, coffee berries, and certa of spices. The annexed photograp us a sample of Java coffee, som years old, almost every herry of wh has been bored by this pest, .Fortunai the stacks of this beetle do not all the stateth of the coffee when the quality of the coffee when Nevertheless, it is quite certain th buying old coffee one buys also a amount of ground-up beeties

WHY MOT A GOOD BOADS LABORATORY!

WHY NOT A GOOD BALDS LABORATORY!

WHY NOT A GOOD BALDS LABORATORY!

A used important one in the United States,
has recently been rendered of critical urgmobile—the must destructive vehicle to read surface
that ever run on our modern highways. The public
restructive offerts of automobile tradic should be
destructive offerts of automobile tradic should be
tempored by the recognition of the fact that it has been the most active instrument in awakening the public to the necessity for abandoning the old slip-abod methods of road building, and constructing them secording to the best engineering practice if it were possible to robuild all our roads of the

most approved and highest class of construction, and if the most suitable material were everywhere avail able, the problem would be greatly simplified, but such uniform excellence is impossible, both because of maintained and the unity of include recognition and analysis within excensive in builting distance of the work in a country of such wide extent and such varied geological formation as the United Battes, the question of the best kind of reads to build in any locality must be determined largely by the local conditions—the climate, particularly as regards the amount and distribution of the raiseful, the ustare of the underlying soil to bearing quantity, especify or quick drainage, etc. and show all, the character of the materials available for read building, must all The Prench engineers, with their characteristic thoroughness, have long recognized the importance and complexity of the good reads problem, and nearly haif a century ago they commenced that careful investil a restury ago they commenced that careful investil settlem which is still being carried on by a force of the cost and of the difficulty of finding the ideal

a century ago they commenced that carrell livestly action which is still being curried on by a force of trained experts. The anatytical study of the subbect, which was set on foot by M Burlel, Reginers of Reads and Birldges, as far back as 1858 has developed into the present musicinal laboratory, which has so considered by many to be the fluwel in existence At the date mentioned, apparatus was installed for testing the resistance of paring materials to wear by ricting, which was followed by a machine for testing the resistance to abrasion of the stone used in Machine and the statement of the stone used in Machine and the statement of the stone used in Machine and the statement of the stone used in Machine and the statement of the stone used in Machine and the statement of the stone used in Machine and the statement of the stone used in Machine and the statement of the statement

Now here, it seems to us, is a plan which might very well be followed in this country by the found-ting of a national good reads laboratory, say at Wash buston, which might co-operate with similar but smaller institutions provided for and controlled by the various State institutores. The cost of carrying on such institutions would represent but a moderate percentage of the money that is anuually thrown away on the construction and so-called repair of highways by the present defective methods

BATIOVAL STREET LIGHTING

TATIONAL STREET LIGATING

THE proper lighting of a city is not so much a question of the total quantity of light provided as it is of its proper distribution. Because of the fact that America is the birthipine or modern selection illimination, and the country is which it was first developed on in tetra weeks, there is a popular impression that our rive scale, there is a popular impression that our rive scale, there is a popular impression that our rive scale, there is a propier impression that our which we have distributed our lighting, the resultant illumination, judged by its adaptability to the

eds of the user; is far less salisfactory than it

monds of the user, is far less minimized by their translation of the user, is far less minimized by their translation of the less and the federal as the lighting of European cities. This question was recently dealt with by Dr. Loais Bell in a paper read before the American Boolety of Musichal Improvements at its assual conventions and the principles which he lad does are at each so obviously sound and so frequently disregarded, that they are will routhy of cartain study by the municipal authorities throughout the construction of the control particular character of the streats in which it is plared The must thorough have, in which there is considerable night termin, should receive as amount in circular where trade is light, and where passers-by are few. It is sufficient to provide mough light to enable the people to get about comfortably is also, a third class of streats, lying more remote and centing under the head of subtrans reads, require coming under the head of authorizan roads, require yet another method of illumination Since the funda-mental purpose of lamps in the outlying, little-used streets, is to serve as markars of the way, the naing of very large units, widely spaced, is obviously im proper, a better way would be to employ small units located at shorter intervals.

located at shorter intervals.

The principal streets of American cities, according to Dr Boil, as a rule are poorly lighted, the secondary streets are lighted sometimes better and sometimes worse than they about be, and the third sometimes worse than they should be, and the thrift clean usually have one kamp in every long block, which is useless, except within a comparatively short radius, for such purposes as facility than un-ber of a house or reading the address in a nots book. As to the absorbet amount or light required, the principle should be followed that in the principle streets one should sever where have enough light to read a paper by, which is the standard of illumina-tion adopted in the principles streets of the large cities of England and continental Europe Rathes is chargealle to the method commonly am ployed for measuring street illumination. The usual plan is to measure the light half way between the

lan is to measure the light half way between the iamps with the photometer disk held normal to the lamps with the photometer disk held normal to the ray, and, naturally, the tendeurcy of competitors for this lighting contracts is to secure the specified mini-num at as low a maximum as possible Indeed, owritin types of illuminatus have been deliberately specialized for the purpose of giving two-bundredths or three-hundredths of a foot-caselle at a distant point. New, if these liminatus had been designed as they should have been, not to give a special form of iliminiation, but to give the best efficiency of which they were capable, it would be possible to make then light not ouly widely distant parts of the street, but the whole street. While it is not desired to attain to uniformity with a low average of able to attain to utiformity with a low average of light, it is equally underlinible to concentrate the light at certain points separated by long stretches of comparative darkness Summing up, the important points to bear in mind are, first, that streets are lighted for the people to use, second, that that streets about the lighted with reference to the particular about the lighted with reference to the particular light, apeaking generally, all the streets should be more brilliantly lighted than is customary in the United States to-day

A BATTLESKIP PLEET IN BAUM OCHAW.

A BATTLEMET FIRST IN BAIR OCEAN,

A BATTLEMET FIRST IN BAIR OCEAN,

O'R many years one Navy Department has followed the policy of concentrating at unamazing the property of the control of the property of the total displacement.

Every nation is following the same policy today, and has done so since the introduction of the first freadnought to 100e Many years before that data, however, the United States had practically cossed to half protected cruisers, and was concentrating to
strength in reseals of the arthered chast, dis majority of which were heavily-guarant latifications. The offeractage of this policy is solid in both late.

The offeractage of this policy is solid in both late.

ELECTRICITY.

As a second missing of the Electrical Club of Chi-cage, it was brought out that there are three thou-sand storage shatery missionlies in Chicago. There are thirty-three storage battery installations in the city with an output of 47,000 kilowatis, while in New York city the total output is 87,000 kilowatis, while in

York city the total output is \$7,000 historia.
As old bargs has been equipped with electric welding apparatus at Gothestern, Swedon, to be used in regaring the bollen of steinners. The equipment consists of a De Lavat turbine and two direct-current generators. The current is condected to the steamer requiring repairs by means of a pair of cables, and work can thus be done within the bollen with power generated on the bargs. The bargs is also fitted with a workshop where small repairs may be made.

An enterprising newspaper in South America about to install a wireless telegraph system at main office. This will be the first wireless newspaper mann omose. This will be the first wireless newspaper office on the continent. The paper we refer to is La Prenza, of Buenos Ayres. The Argentine Republic is going to celebrate its hundredth anniversary with an exposition this year, which opens on May and La Prensa expects to keep in "wireless" with the exposition ground

A French inventor, M Faul Jegou, has devised an electrolytic detector which operates without the use of a battery to affect telephone receivers. The detector consists of a glass cup containing at the bottom a tor consists of a glass cup containing at the bottom a small amount of mercury with some pure tin in solu-tion. This serves as one electrode, while the other electrode is of the usual type, namely, a fine Wollaston wire. Dilute subpluric acid is used for the electrolyte wire. Direct surpaire acts is used for the electrolyte The detector is found to act like a gmail battery, and yet pomesses all of the sensitiveness of the electrolytic detector. One of these detectors used at Paris was found to receive signals sont from the Ouessant post on the coast.

Considerable attention has been directed of late to the effect of sunlight on the transmission of liert-slan waves. A writer in Electrorechaised Schickrift, in commenting on this subject, points out that the stronger the austhing the less the conductivity of either to the Hertains waves, so that it is incorrect to ether to the Hertzian waves, so that it is incorrect to speak of a wireless telegraph station as having any definite range, for one which has a large radius of communication in northern istitudes would have a much smaller radius in the tropics This would be particularly noticeable on vessels sailing north and south, and he suggests that it would be desi prepare a "radio-topographical" map, giving the rela-tive conductivity of the ether at different latitudes

A comparison of the inclosed are and the intensified are for indeer lighting was recently presented before the Minnesota Electrical Association convention. It the Minneson Riccircal Association convention it was shown that because of the large carbons used in the Incised are, the carbons being half an inch in the Incised are, the carbons being half an inch in diameter, the are is any to wanger along the edge of the electrode, so that instead of giving a uniform distribution of light, the light is greater on one are tribution of light, the light is greater on one are tamp, there is no wandering of the art. The sector of the control of the trodes a quarter of an inch in diameter, and a lower one three-sighths of an inch in diameter. If the same amount of current is passed through this lamp as through the inciosed arc lamp, the electrodes will be hested to a higher incandesounce, thus giving a greater and steadler light.

bested to a higher incandescence, thus giving a greater and steadier light.

The Board of Underwitters of Chicago has insued the following requirements for wireless telegraph in stallations Aerial confinctor must be at least No. 8 B and 8, gape rubbercovered wire run on potitional insulations on exterior of building and on hone, cleats run nothing in interior of building, Proviolate bushings to be used through walk, partitions and foortheen the contract of the state of the contract of the

G. A. Campbell recently conducted some experiinvestigate the subject of teleph to Investigate the subject of telephone intelligibility in his experiments, usually only detached withhis were supplyed, so as to give the listener no cine from the context. The syllables easy to interchange are right in about half the cases. Thus while it is obvious that the belophone controlly distorts spoech wares, not the context to the context which nearly resemble such other are not sufficiently distorted to be indistinguishable.

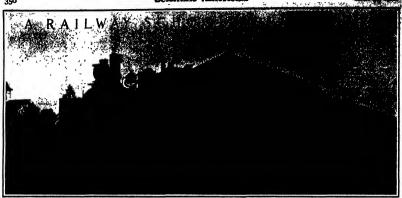

A good photometrio measurement of the brightness of the nucleus of Hattey's comet was obtained on April 21st by Prof Wendeli at the Harvard Coliege Observa-tory The measured magnitude of the nucleus was 64 tory The measured magnitude of the nucleus was 45 the total brightness of both the outleas and the sur rounding coma was a little above the fifth magnitude. With the approach of the most loward the region in the sky in which the connet is found there will be very little to rough the early riser in fact, astronomers do not look for any spectacular display while the connet is in the eastern sky.

From a study of the radio-artivity at the earth s surface, made by G A Cline, it would seem that the soil contributes by far the greater proportion of the peocirating radiation present at the earth's surface at Toronto, and by comparison any that may heve its source in the atmosphere or io the sun may be considered to be negligible in amount. There are no diurnal maxima or minima, but the changes from day to day which seem connected with changes from day to day which seem connected with concurrent barometric cheoges. The conductivity is greater when the ground is baro and warm than when it is frosen and covored with snow Fittering air through cotton-wool still leaves many snepension particion

A letter has been received from Prof E B Frost, irector of the Yorkes Observatory, at Harvard Coliege Observatory, in which Prof Frost records recent observations of Halley's comet. He found the comet more conspicuous than the adjacent star Pascium, and Prof Barnard estimated the nucleus which not stellar, to be two megnitudes feinter than star On April 14th the comet was photographed with six minutes exposure No tail was visible with any of the instruments Visual observations of the spectrum were made by Prof Frost and Dr Si trum were made by Prof Frost and Dr Slovum, and showed a distinct continuous spectrum from the nucleus No bright bands or times were seen. The intensity of the continuous spectrum relative to the emission bands, itse greatly changed since the comot was visible in the evening

Some idea of the enormous amount of labor required to extract radioactive substances from their ores may be gained when it is considered that to obtain two miligrammes of substance containing 0 in miligramme of polonium. It was necessary for Médame Curle and A Debirme to treat several tons of uranium Pairly pure helion was isolated from the gasees given of by a solation of polonium under a high vacuum to a quarta tube, due to the artion of the siphs rays emitted by this element. The life of radium is about more contained to the containing the con to extract radio-active substances from their ores may from radium. The atomic weight was estimated to be about 200

A new preparation has appeared which cleans and polishes sliver, silver plate, nickel and other white metals, and which is said to produce a plating on pursliver and any metal except gold by mere contact of the preparation with the metal in view of the pubthe preparation with the motal in view of the pub-licity given lately in British scientific journals to a similar preparation invented by Rosenberger it is in teresting to note that the American article has been known in the United States for several years although offered more prominently only since 1908 offered more prominently only since 1908. Rosenberg-er's preparation requires a different modification fo-ceach metal. The American preparation is a white, oreany liquid, perfectly stable and numflected by light, and is claimed to be perfectly free from morrory, solds and other injurious ingredients. So far as we are asite to determine, its platting action secons to be due to the stabling which the motist to be platted certain. due to the silinity which the motal to be plated exerts upon the molecules of all laws in the solution, so that the resultant plating is identical with that produced hy ordinary dynamic electroplating. No electric cur-rent is necessary to produce the plating nor is an ad-dition or admixture of any other gubstance required.

Demonstration train at a way station in California.

in response to an urgent request from leading dairy interests in Southern California, Prof Lercy Anderson, head of the dairy department of the Callfornia College of Agriculture, has just made an examination of the milk conditions in that part of the

Prof Anderson says that in consultation with the Prof Abderson says that in consultation with the dairymen, it was decided to inaugurate a general policy of education upon the subject in his opinion, the reform of many conditions now undesirable in the methods of producing milk, can better be reached through the commercial aspect of the business and through the education of the producer and the con-sumer than through drastic and radical legislation

sumer than through drastic and radical spissation.

He says that he finds the conditions under which
fillk is produced about Los Angeles are not materially
different from conditions in other populous centers,
crospit that nature is possibly kinder in granting more

except that nature is possinly singler in graduling more sunshine and less ratis and a more porous soil, all of which tend toward an easier cleanliness. What advice he has to offer, therefore, is applicable to all parts of California. He hopes especially that the man who is producing and selling directly to conthe man who is producing and sening directly to con-sumers in the smaller towns and cities, whether he has one cow or more, may receive an Incentive to have better cowe and keep them in a clean and a healthy condition

healthy condition In cities like Los Angeles and San Francisco, he says, where large wholesalers act as distributing agen cless between the producer and the consumer and pastetrize all the milk, some of the dangers that might result from disease of the cow and uncleaniobviated

ness are obviated "it does not have a pretty sound," continues the professor, "to say that lack of care on the part of the producers is partly the reason for the expensive pasturisation which the wholessiers

now give to milk."
"Pasteurisation, however, ie one
of the advance ateps toward a
healthler race, and some day this
process will give way to such clean
methods of producing milk that it
will not be necessary That is the
goal toward which we are all striv-

ing "It costs money to produce clean milk, which cost must be met by a higher selling price or hy more profitable cowe, or both The cow is especially in our mind just now, and we call the reader's attention to records taken from different sources to show by actual figures how cows vary in returns to their owners from elmilar outlay for food

and care"

Prof Anderson then refers to the
subject of proper stables and corrais for dairy cowe and says

"The great thing to be desired in
either, is that there should be easy
means of keeping clean and then coop them clean. This is the chief It done not decay and then foul bdors, and it can be down with water and sweet in a few moments, so that no dirt remains. So datrymen object to cows standing on concrete, but in California, where the cows are in only for feeding

in California, where the cows are in only for feeding and milking, they enfer no injury
"Occasionally a very good stable is constructed where the cattle stand, which portion is made of plank. This works well from a sanitary point, if the planks are water-tight or are understad with a strength substance so that the soil under the planks cantilght substance so that the soil under the planks cannot become seturated

not become saturated

"A milking stable is absolutely essential to the production of clean milk Milking in the corral is an abomination, either in winter or in eummer. In win ler, during the rainy season, it is not uncommon to

ier, during the rainy season, it is not uncommon to see both cow and milker wasting nearly to the knees in mud, when of necessity the milk must become the depository for some of the mud.

"In summer, when the corral dust may be from one to four inches deep, the condition is even worse. The dust is raised with any slight breess or with every dust is raised with any siight breeze of with every movement of man or best, and even more dirt finds its way into the milk than during the time of rain and mnd. Thus the cows must be provided with some stable which is dry and clean, and where they can be held for milking

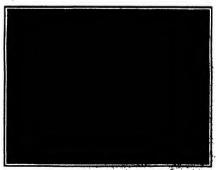

"The stable needs not be expensive On the con-trary, it may be very simple, and the less lumber in it the botter so long as the frame is sufficiently strong it should permit the cutrance of an abundance of direct sunlight and have enough openings to give con stant ventilation. Large lonvers in the roof are excellent for ventilation and also admit light, but not

Saloi Liniment for Burns.—Saloi, 10 parts; olive oil, 60 parts; lime water, 50 parts

Bread Under the Hieroscope,
Bread, lite mith, is one of the most general articles of food, and as such is subjected to the most frequent adultation, and unfortunately it happens that desired in the such is subjected to the most frequent adultation, and unfortunately it happens that the subject of the subj No lies set aside for further examination Besides, to the water in the vessel is given an opportunity to clear itself, and it is then decanted so carefully that the sediment is not disturbed. The result of anch treatment is that from the deposit on the sieve and that in the vessel the true composition of the bread on he assertained.

Bread made from pure flour leaves only an imper ceptible quantity of starch on the sieve On the other hand the greater part of the ginten is found on it and

art or the ginten is round on it and forms a not of irregular meshes and shows some resemblance to vegeta-hie tissue In consequence of the case with which its presence in the bread is ascertained, the giuten is especially important for microscopioal examination. In the same decal examination. In the same de-posit the microscope showed nu-merous particles of starch which during the preparation of the bread changed their ordinary form or leave ferend to explosion. Buill there is a resther considerable num-her of them that have escaped this ner or them that have escaped this indicence and are easily recognized from their size, color, form, and the presence of the navel. These state-pents regard wheat bread only. The result when ree bread passes under the same procedure is that the deposit on the sizes consists of glutons only, and therefore propor-tions in a mixture of both kinds of large only an association with a large discress of anatomos under the antencorote. Tradeslary, however, in this dense through a last of the promption of flow, done of graning promption of flow, done of graning promption of flow, done of graning promption of the property of the delinest control of the pro-dict of the state of the state of the state of the state of the delinest of the state of the sta out on the sleve on

placents. The most resemblance to these is shown by the grains of barley, the addition of which is ascer-tained with a satisfactory degree of certainty from the precipitate on the sieve A quite customary adulter-tion of hread is effected with rice flour, which always

falls to escape the scrutiny of the microscope when this is invoked, for the grains of starch of rice are always left in great number on the sleve and are more easily recognized because during the preparation of bread they suffer less change. This result of M. Col

ita's investigation is extraordinarily important, for the addition of rice flour to wheat flour or to rye flour has begun to be a veritable torment Besidos, certain kinds of corn meal have been misused in the same

REAPER BOAT Α

BY THE PARIS CORRESPONDENT OF THE SCIENTIFIC AMERICAN

A French constructor, A Amiot, has brought out a type of beat combined with a set of cutting blades, which is designed for me in cutting off squared provides a set of cutting blades, which is designed for which contains the contained of the con A French constructor. A Amiot, has brought out an internal combustion motor mounted on a boat, an the motor serves to drive a set of cutting blades, which are designed somewhat after the fashion of reaper blades and adapted in their form so as to carry out blades and adapted in their form so as to carry out the cutting of the plants under water in the best man ner The boat is rather narrow, and fist bottomed, being much narrowed at the front and the rear In the front is carried a paddle wheel, which is run by a gusoline motor, which

Its total length is

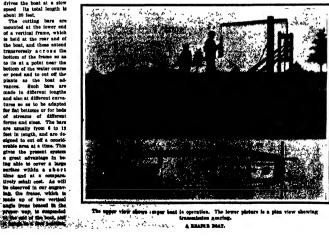

the cutting bars are mounted at the lower end of a vertical frame, which is held at the rear and of the boat, and these extend transversely across the bottom of the frame so as to lie at a point near tha bottom of the water course or pend and to cut off the plants as the boat ad-vances. Such bars are made in different longths and also at different curva-tures so as to be adapted fat bettoms or for beds streams of different ms and sizes. The bars forms and sizes. The bars are usually from 6 to 12 feet in length, and are de-signed to cut off a consid-wrable area at a time. This gives the present system gives the present system a great advantage in be-ing able to cover a large surface within a short

beins aware then the end of the ferre, which is ob-served at the imper part, and this lever is pitted in an appriabl. By means of the countercepth at the old of the lever, the entire frame can be raised and levered, and this gives the adjustment of the cutting bear at any desired height in a convenient way. The passedine motor is placed at the other end of the beat, and there is a belt transmission running to the rear and there is a belt transmission running to the rear-part of the cutting bar frame. This does not later free with the raising or lowering of the frame, and work at different angies. On the baths of the pulley is a creak which drives a red, and this inst passes down about the frame to the lever part, where it con-deven about the frame to the lever part, where it con-tent is the second of the pulley of the con-tent of the cutting bar frame to the lever part, the cutting bades are given the to and fro movement in the same

way as is seen in the usual bindes, and in this way a wide swath is cut under water and at any desired height above the bottom The paddie wheel is carried height above the bottom. The paddie wheel is carried on a frame which is adjustable by means of botte, so as to give the paddies any feetred immersion, and the specifies most of river the wheel by pareling and chain device, using two separate counternhafts for this purpose so as to give the nuevide speed reduction. The guardies motor is operated at the standard speed of 50 revolutions per minute When it is required to 50 revolutions. take the boat into shallow water or otherwise to pass over rocks or other obstacles, the cutting frame can be iffed entirely ont of the water. In this case the cutting bars are folded up along each side of the frame cutting pars are toiced up along each side of the frame so as to eccupy but little space. In usual practice the cuiting is carried out at the rate of 1½ miles an hoar, and the cost of operating is estimated at \$0.55 per mile, compositing gasoline, oil, ishor, together with depreciation and maintenance. For cutting one acre area, the cost is figured at \$2.70

The Amiot system is meeting with great sucneesing with great suc-cess in Europe, and it is now in use on the artifi-cial inkes of the domain of the institute of France, at Chantilly, and also on the donain of Lacken, be-longing to the King of Bel gium It is also used on a number of canals and rivers in France

According to the Elec-trical Review and Western Electrician, the Park Building at Pittsburg, Pa., which is 15 stories high witten is 15 stories high and contains 400 offices, was recently lighted by carbon filament lamps and had its interior decora-tions painted a deep sea green color. It is now green color It is now lighted by tungston lamps, and has its interior paint and has its interior paint od a light buff color On replacing 3,810 carbon lamps (66-watt) by 780 100-watt and 300 25-watt tungsten lamps, and 21, 840 watts in 16 and 32 candle-power (arbon lamps in the corridors and lifts by 8,400 watts in 40-watt and other tungsten lamps, 149 4 kilowatta is saved.

The upper view above conper beat in operation. The lower picture is a plan view showing

THE RESTATOR INSTALLATION OF THE METROPOLITAN LIFE TOWER.

in the newly-completed Metropolitan Life insurance tower is to be found an example of an installation which serves the purpose of lifting cars to an alti-tude greater than that attained in any building yet constructed Judged independently of its height. the installation is a model of modern elevator engineering. Furthermore, it is significant of the succession neering. Furthermore, it is significant of the success-ful development of a comparatively recent type of di-votor machine which has been tested in actual use and found to answer the requirements of service as well as the requirements of mere height. Great as the lift in the designers claim that it is possible to go even higher and that it levels to no even higher and that elevators can be installed to may skyrerograw which the amplitious architect may yet essay As a result of this engineering achieve-ment there is no difficulty in renting offices far above the city's noise and dust. No more time is consur in reaching the 44th story of the Metropolitan to than the 12th floor of older buildings.

For the Metropolitan Life tower, the type of ele For the Metropoilian Life tower, the type of ele-vators selected was the Oils true into overhead machine, in which the motor and driving abserve are situated directly above the hatchway. High up in the apea of this white wardle campazile are to be found power-tiv electric motors, whose installation at this slora-tion trand the ingenuity of the architect and engli mer "Thoy are without doubt the highest motors

working in any building

The problem of high rise in a tower building is The problem of high rise in a tower building is non that can be solved by but few types of elevators. A height of 400 feet marks the limits of the planes and other brigantic inschines in many forms of sisterical elevators the weight of heavy moving cables or other parts, and the exact regulation of the car or lead, are difficult if not impossible of attainment when certain beights are exceeded in the Clit syswhen certain heights are exceeded in the Oils system Illustrated we have a simple mechine that has been found to work with ease, asfety, and reliability a motor is mounted at the top of a shaft or hoistway. The armatares shaft carries between its two bearings a driving shower around which the six cashes suspending the car are passed. One end of the cashes extended to the ear, the other to the counterweight, which moves up and down in guide rails at the aide of the shaft, and is equivalent to the weight of the car and its severage load. Directly below the driving shower in the car and the strength of the strength of the car and the strength of the the urring sheave win with it is it conduct to two half-turns. When the current flows through the motor, the armsture rotates and moves the car up or down as desired. When the current is cut off powerful automatic show brakes are applied to held powerful automatic snow oraces are applied to note the driving sheave A compensating cable in older installations a chain is connected with the bottom of the car, extends to the bottom of the shaft, passes or one car, extends to the bottom or the shaft, passed around sheaves or pulleys, and then extends to the counterweight Its object is to compensate for the weight of the supporting cables, whether the car is at the lop or the bottom of the shaft. In other words, at me top of the honoroom of me same. In other words, the system is very nearly in equilibrium, and the function of the motor is merely to move it with such additional iond as is supplied by the passengers in the cars. When the Metropolitan installation was considered by a board of elevator engineer it was reallised that this system was the only one that would

alised that this system was the only one that would meet the conditions demanded in an office building of satterns height. The thorough tests which the machines have received since their completion has justified the engineers in their selection. The Tower installation, while is quite independent of the elevator systems serving other parts of the hang Metropolitan Building conduits of all expenses elevators, which make no stope between the street and the label of the conduits of the service of the 10th floor The cars are arranged in the center of the tower in two banks or rows of three each, for of the six running from the last in the 4st flow, or of the six running from the last moment of the 1st flow, as a rise of 124 feet 11½ inches. The middle car on the temperature of the 4st flow, while the middle car in the west bank runs from the basement to the 4st flow, while the middle car in the west bank runs from the basement to the highest landing in the tower on the basement to the highest landing in the tower on the 44th floor, a distance of 585 feet 1½ inches. With a 1st lead of 2,500 pounds, or about 15 passempers, the last lead of 500 feet per minute without care can make a speed of 600 feet per minute without stop, which is the maximum permitted by the premitted principles. These stop, which is the maximum permitted by the premitted principles of the 1st flower concerns that flower the 1st flower concerns that flower concerns that flower the 1st flower concerns that flower concerns that flower the 1st flower that the flower concerns that flower the 1st flower than 1st flower t the journey to the top floor consumes but a few sounds under a minute which is recognised as about t the journey to the top noor consumes but a raw sec-onds under a minute which is recognized as about the limit demanded by office building resting conditions. The actual consumption of time by the passenger The accuta continuity of time to the passage over lower hulding, where alover speeds and frequent stops may require the same expenditure of time. In this connection it may be remarked that the trunction machine illustrated can accelerate from a step to full speed in from two to three seconds smoothly

duity a total chaineau of his for the mines of the engineer nebrandly contents for the engineer nebrandly contents for the state of the state of the engineer nebrandly successful to the total content of the engineer of the navy machinery. Mayetor installation was not a final feet

construction of the tower, but an ever-present con-tion. As fast as the structural workers completed tion. As fast as the principular workers completed the framework, the rails for the care were set in Stock, and a temporary elevator was rigged to send by the materials of construction. As the materials for the five machines for the elevatory running to the fills floor could be carried up by the high-rise elevator, their erection was not so difficult a matter When It be-come necessary to raise the materials for elevator No.2 came necessary to raise the machine for elevator No. 1 up to the 65th story, a perious problem was present. Breatmaily, the teak was accomplished, and the huge cartiags and armature were sent up to a point where they could be set in place by an ordinary tackle. These machines, 1500 periods some for two elevators where devices are employed to enable active heart of the controllers weigh 5,000 and 3,300 periods respectively for the two classes of machines. It is here that the operation of the switches governing the motors one-true where the controllers weigh 5,000 and 5,000 periods respectively for the two classes of machines. It is here that the operation of the switches governing the motors one-true which switches are made the control of the sar

The motors are rated at 40 horse-p The motors are rated at 40 horse-power and use in Total direct current. They run at a speed of from 55 to 18 revolutions per minute, and the peripheral vicelity of the driving shawes on the armature shaft gives the speed of the car. The limited space in a thigh tower presents problems quits different from the tower of the car. The limited space in a thigh tower presents problems quits different from a remarkable of the speed of the car. The limited space in the strength of the speed of the spee

Around the driving sheaves pass the lifting and counterweight schles, at it is number for each machine. They are % of an inch in diameter, and each chief has a breaking strungth of 28,000 pounds. The length of the several exhibes for the various care varies from 575 to 624 feet for the high-rise car Another important cable is that passing through the cut to the cutrifficial speed governor at the lop of the batchway. These are %-inch cables, and they vary in length from 1144 to 3.21f cheef. Their frontion is to transmit the Around the driving sheaves pass the lifting and 1144 to 1,274 feet. Their function is to transmit the motion of the car to the centrifund governor, which is case of excess speed, not only cuts off the power, but causes the astry device of the car to come the play and lock it firmly to the rails. The cars, which vary from if feet d luckes by 8 feet 4 simbs to 844 inches by 8 feet 4 simbs to 8.4 inches by 8 feet, weigh about 6,000 to 4,000 pounds such. The counterweight is slightly heavier than the empty can be that the car is assumed to carry an average.

HALLEY'S COMET -A MODEL OF ITS CREET.

For the large number of people now interested in the famous Halley e comet who have found difficulty in obtaining an intelligent idea of its motion in space its apparent motion in the sky and the times of its visibility a cardboard reliof model like that of which a photograph is herewith reproduced will be of great assistance. And even those who already understand the phenomena from the study of plane diagrams may obtain a much clearer idea of them from the model because it is much more concrete and represents the sun and the orbits of the comet and the earth as they really exist in space and not as they are often show

really crist in space and not as they are often shown by being projected on the same plane. In order that the readers of the Scruvrino Awrat can may easily construct such a model for themselves patterns or diagrams are printed on the secompany ing loces-leaf supplement which when pasted on card board cut out and properly fitted together will make an excellent model

After teiling how to construct the mo

Arter testing now to construct the model some de-scription will be given suplaining how the artronomi cal phenomena may be studied from it Having first pasted the icose-test on a sheet of card board about 10-pty cut out the three diagrams along the dotted lines Also cut a narrow slot through the the coviced lines. Also cut a marrow slot through the planes of both the comets and earths orbits at the places marked. Then insert the planes into each other as far as the alots will allow keeping the earth a orbit below that of the comet on the right but above it on the left.

If the two planes are correctly fitted together they will now produce the general effect shown in the pho-tograph But besides having the model rigid the two

tograph. But besides having the moder rigid the two planes must be given the necessary inclination to each other of approximately 18 degrees. The state of the planes together peating two must. Parties the two planes togethers peating two must be all the planes together peating to the contract of the sum keeping the slotts in time. Then bend side of the sum keeping the slotts in time. Then bend side over the finge of the triangle along the two lines marked on it peats it as a wedge between the plane of the sum of

indicated at intervals of ten days before and after perihelion as it travels in its orbit in the direction of permental as it caves in its orbit is the direction of the arrows. The earth's position as it yearly moves about the sun in the opposite direction is also shown for the same days. The printed side of the model

Examining the comets path in space we see that

manufacture the counts path in space we see that the through the plane of the electric at the second ing node symbol 2 in January On April 18th it was at perfision On May 18th 18th it cuts through the plane of the ecliptic at the electric at the support the plane of the ecliptic at the descending node Daring the early part of the year the counts and the sards part of the year the counts and the sards part of the part of the count givey brighter only by a change in its intrinsic littlinary. Now however the orbits are rounding including the count of the proposition of the proposition of the part of th

The time of viability of the comet will depend on whether it is the left or right of the san as seen from the earth. To transfer correctly to the sky left and right on the model we should imagine the sen on the merdida at soon with the comet to the left or right. Taking the way that common observation shows the sun to move across the sky from each show the sun to move across the sky from each of the servation o

anything to the right at noon will rise and set certier than the sum. Hence before he comet being to the Hence before March 28th the comet being to the sit of the sun rose in daylight but set after the sun and was visible in the evening At present it is to the right of the san and rises before it in the morn-ing increasing its distance until May 8th when it reaches its greatest western compation it then ap-proaches the sun and cross into inferior conjunction of May 18th 18th

As the three celestial bodies are also in the saw plans on this date the olreumstance makes it possible for us to go through the comets tall if it is long for us to go through the comes tail if it is long senough to reach us What we shall see on that night it is not the purpose of the present article to consider but it may be said that as the moon is then approaching full a fact which has been somewhat overtooked we may not see anything at all.

The comet and the earth are fourteen million miles distant May 18th 19th but their closest approach or

custant May 18th 19th but their closest approach of curra a day later when they are thirteen million miles apart. The closest approach of the orbits is at a point a little below to the left where the comets orbit is six and one half million miles below the earth s. On diagrams where both orbits are projected to plane they apparently intersect at this point as some people have imagined a possible collision here but the orbits never intersect as the m

On and after May 20th as the omet is to the left of the sun in the model it will again be visible in On and arrer may you as an of the sun in the model it will again be visible in the western aky birg seen as soon as it is dark enough and setting about two hours after smast which time will gradually increase 1) four hours by which time will gradually increase 1) four hours by the end of May But as the low lodies are then re-ceding in almost opposite directions and the tail is turning more and more away from us the giory of Hallor's comet will soon be lost to us for three-quar tors of a entury

Three of the contestants making a turn in the "Championship of the Sea" race

sible the attainment of great speed on-

Three of the centestants making a turn i that make possible the attainment of great speed expe inity in the long-distance revents. The first long distance race for the Championship of the first was the distance race for the Championship of the first long distance race for the Championship of the first long distance race for crust at a question of 2.51 miles per hour Out of the 32 couped in so in the long distance race for crusters the Championship of 12 couped in so in the long distance race for crusters the Championship of 12 couped in 12 couped in so in the long distance race for crusters the Championship of 12 couped in 12 couped i shows the twin screws of the Unusa. Her chapters are arranged side by side one on each side of the bull Another photograph shows the Ursuia at full my d white a third it ture shows the Brasier Despujois The difference in the amount of spray thrown by these two boats is interesting the former. carrow by these two locate is interesting the former cuts through the water with very little disturbance while the latter skims over it with a good deal of apissahiny. The great 1: helarity with which the Ur-sula speeded around the course for nearly an hour

out slowing down and at each tarn the beat would the dangerously. The Ursula showed hereaft to be one of the fastest motor boats that have over bru built built in the mile and kilometer speed trials she did not make anything like the time that she is reported to have accomplished in the long distance races in fact, the hydroplane best her in the speed trials owing to its ability to get under way active. The time of the mile from a standing start and of the fivine of the mile from a standing start and of the fivine of the mile are follows:

			Miles
	Mile	Kilometer	an Hour
Braster Despuiols	3 20		25 71
Brasier-Dospujols		50 3-5 sec	44 26
Ursula	2 26 2-5		20 00
Urenia		55 2 5 sec	40 81

The Urusia this year is fitted with the same two 13-cytinder Wolselwy Hiddeley molors that were used inst year. As her best speed then was about \$7\$ miles per hour it is fair to saesthe that the figures tree in the cauble reports are not correct or also that the distances around the course were less than that the distances around the course were less than that the distances around the course were less than that the distances around the course that this figure is the long race especially since abe made only 403 miles as hour in the fying kilometer speed trail We understand that on account of the great depth of the water where the race are held thors is often times a shifting of the boury owing to the inclinations as shifting of the boury owing to the inclination of the course. The mile and kilometer tests are therefore the only once in which any great de

have averaged 48 miles an hour with the same power plant as heretofore is very creditable

An Acroplane Flight with Five Perm Cross-Country Flying in France.

One of the most remarkable performances ever mad with an aeropiane was that of Roger Sommers ne biplane last work in France when piloted by its com sipane last work in France when piloted by its own structor it carried him and four other persons in a five-minute cross country fight. On this occasion the astropiane lifted some 750 pounds of dead weight or probably a total weight of 3 800 pounds with presuma-

probably a total weight of \$100 pounds with presuma-by a 60-large sover motor.

Apothas demonstration of the-development of the however than air machine was given in April 1816 by Lonis Itsulhan who few from Orieans to Archevita-table 113 miles in 134 hours on his Farman birther. Ashe (118 miles in 134 hours on his Farman birther. The next day he few 44% tules farther across country in 1 hour and 10 minutes reaching a height of 184 to Henty Farman on the 17th hastant also few 40 miles

renty Farman on the 17th instant also flav 60 miles arross country with a passenger. These brilliant flights form an ocular demonstration of the great advance recordly made in dynamic slight, and point the vary to the pre-total utilisation of the seroplans for the transportation of individuals and of mail

Selection Assessed

per minute. The cylinders are set with steel blades, parallel to the axis, and the plate bears a number of steel blades, slightly inclined to those of the cylin-ders. The finely ground nitrocellulose next goes to the blocachery, where it is treated with chlorine, hydrothe hieachery, where it is treated with chlorine, hydro-gen dioxide sulphurous seld, potassium permanganate and other decolorizing agents. It is then washed thoroughly, pressed between rollers, and dried Collutold is made by dissolving nitrocellulose in an

airchoife solution of camphor Some manufacturers mix the esuphor with the moist produ pressure which contains 40 per cent of water, while others add the camphor to the dried nitrocellulose in the locator case the moist pulp, camphor and color-In the first-own class the moint julp, camphar and color-off matter are ground together between horizontal, circularly fluid from "militations". The mixture is passed several itions through this mill, and is then dried. When the nitrocellulous is dried separately the illumps formed in the passeds through the order press are crushed by rubbing the pulp, with the hand through a coarse wire serves.

through a coarse wire across Drying is effected indirectly by pressing the pulp between layers of absorbent material. The pulp is aprend on a cloth which is turned up over it, forming spread on a cioth which is turned up over it, forming as retangular cake 24 inches long 20 inches wide, and about % inch thick. In the factory of the Société Industrielle du Celluloid these cakes are piled alternately with dry feits a sheet of iron boing introduced

nately with dry felta a sheet of tron boling is after each ten or fifteen cakes, in order to facilitate handling. Then pile is then subject to a hydraulic pressure of about 350 period in a hydraulic pressure of about 350 period in the hydraulic pressure of about 350 period in the hydraulic pressure of about 350 period in the hydraulic pressure and the operation is repeated until the nitrovillation is dry. The compressor cakes are now unwarped and backen into fragments for solution. If the campbot has been added before drying the camphor has been added before drying the broken cakes are simply sprinkled with al cohol, but if the dried nitrocellulose con-tains no camphor it is moistened with a sulution of 90 parts by weight of camphor

In 100 parts of alcohol

The solvent is allowed to act for 24 hours and then the mass is rolled between hollow iron cylinders, from 12 to 26 inches in di ameter, which make 10 revolutions per min atheter, which make 10 revolutions per inin ute, and are conied or heated, as desired by a circulation of cold water or steam in their luterior From 65 to 130 pounds of celluioid ar relied at a time the rolling being continued from haif an hour to sev being continued from helf an hour to several hours. Toward the ond of the opera-tion the sylinders are brought tlose to-gother in order to produce a thin sheet of exiting the sheet are converted into blocks. The rolled sheets are triumed to the cazed dimensions of the press, and the trimmings go back to the rolling mill. In the Champingseth block press a strong iron box 16 inches tong, 25 inches wide and

ick the presence of cellular to a light block by pressing between two from plates. The top plate is fixed in position, while the bottom plate is carried by a plunger which onters a cylinder below and is forced which others a cylinder below and is forced upward by hydraulic pressure of 250 (one is applied for a period verying from 50 to 1) source, during which the collusion is kept at temperature of from 156 to 1 below. It is a circulation of hot water in the interfer of the plates and the double walk of the for. The mass is cooled by substituting old for hel water the pressure being continued during the colling. The top plate is then removed and

the block of celluiold is forced out of the top of the box by again applying pressure from below

box hy again applying pressure from below.

The blocks are cut into bands or rods according to
the purpose for which the celluloid is to be used The bands are cut by a machine in which a knife, the edge of which is inclined 40 degrees to the horizontsi, is forced downward by a serew in this way bands varying in thickness from 1/250 inch to 1% inch can be obtained. Celluloid is cut into rods or fibers by a machine in which the cutting tool has the form of a short cylinder of diameter varying accord ing to the size of rod desired

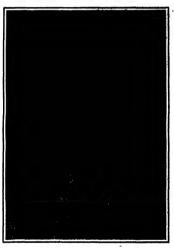

he celluloid, after it is cut up is dried in cham bers where the temperature is never allowed to excord 111 deg F on account of the danger of explo-sion. The time required for desicration varies sion 'The time required for desiccation varies greatly with the thickness of the bands or rods Bands thinner than 1/100 inch dry in a few hours while strips thick enough to be used in making knife ham dies, for example must remain in the drying cham her about six months.

Tubes of celluioid are made directly from the roll sheds in an apparatus which comprises two vertical cylinders, with their area in the same line and thair pictons sunnerted by a stout red. The bettern of the

lower cylinder has a central orthos, to which as apertures of various dimensions on he adjusted the lower part of the cylinder is heated by a of the orthogonal or the cylinder in introduced the cylinder and the cylinder has been part of the cylinder. the lower part of the sylinder is heated by a devisible ton of bot water. The callulad is fairnessed Side this cylinder and hydraulic pressure is applied to means of the sylinder above. The calluloid, settlened by the beat, is thus forced through the aperture the form of a tube, which the operator draws away and cuts into convenient lengths by means of a cleany attached to a cord passing our reversible pullup.

To return to the bands of calluided which have been cut from the presend blocks. In the drying chambers these bands become warped. They are Satisted in a hydraulic pollular press which searts a presents of hydraulic pollular press which searts a presents of

these bands become warpen. here are a pressure of about 1,000 tons. The cellular press which saard as pressure of about 1,000 tons. The cellular bands are piled alternativy with select of positible brans or nichelyades ready and the same piled alternativy with select of positible brans are piled alternativy with select of the piled brans or cell water. While the pressure is applied the pintes centain channels for the other cases or cell water. While the pressure is applied the pintes are first heated by steam to 150 or 150 deep for a few minutes and are then cooled by cold water. When the bands are taken from the growth of the pintes of t

Pluttening celluloid hands that have warped in drying, THE MANUFACTURE OF CELLULOID.

be noted. For this purpose two blocks of celluloid of different colors are made separately in the block press and cut into bands about 1/100 inch thick. A pile of these bands, arranged in alternating colors, is alless with a powerful paper knife. The fine strips of colin

with a powerful paper laife. The fine stripe of cells-iold of two colors resulting from this operation are arranged regularly or irregularly in the block press and converted into a solid block of striped; valued, marked or "watered" appearance. From the bands, rods and tubes or plain and water-aried cellsines, objects of every form and character, researcing the appearance of youry, tortoics ships, heaves and other woods, corid, unber, jack, make, chile, silker afforts, etc., are made by reprise plain-tions, of which the most important are "happing, chile thing out modeling, cerving, blocking, variantificing and ting out molding curving, blowing, warn

area had a great amount of color surrounding star images and a great amount of color surrounding them. A leas may be regarded as a round prism Since a prism not only deviates light but breaks it up into the spectrum colors, a simple leas will act as is shown in Fig. 4, the velocit light is most re-fracted and is brought to a focus at o, the less refrangible red comes to a focus at R, with rays of the other colors in between these two extremes. The reother colors in between these two extremes. The re-sult of all this is that if we force for the yellow, the ved and violet form rings around this and a star image is anrounded with a considerable amount of color fit least. Newton was the first to explain these abservations, and it is attempts that although he made experiments to prove that giass and water disperse light differently, he did not forestall Dolland's dis-covery (160 years ago) of making as objective from a combination of two lesses, one a double convext of the stars.

int glass. With such a combination the optician has four surfaces to figure, and as a result it is possible to aimest entirely eliminate the spherical aberration, or in others words make a flat field. But on the other hand it is still impossible to act entirely rid of color Fint

FIR 4 -CHROWATIO ANDRESTON.

and crown glass do not disperse light allie, the fitteriatively yieldness set the violet and the more from optician with glass of two different sorts at his disperse to the control of the post can bring two colors of the spectrum to a sharp focus. For a visual telescope the rays generally takes are the relieve and the bites green. Consequently both the red and the violet ends of the appetrum are not nearly point, and these form rings about the steinar image which combine to make purples color in small telescopes this color is not so promounced, but with large telescopes of 36 inches or more aperture with large telescopes of 36 inches or more aperture. It is all the colors as the "secondary spectrum."

The problem of making a good visual tens is ratify a much simpler one than that of making a good pholeand crown gians do not disperse light atike, the flint

The problem of making a good visual iens is really amost aimplier one than that of making a good pholographic one. In the first place, in the ordinary telescope for visual purposes, the field is comparatively small, of only a few minutes of are, and the process of making a field fast over the area is simple compared with that required in an instrument life the Bruce pholographic telescope of the Twekes Observatory, which pholographs an area in the sky 15 deg square. With structuring the decomes the ratio of agenture to focal length is about in the ratio of 1 if (the article of 1 if (the contraction) of the real contraction of the ratio of the real contraction of the rea of nearly 1 . 19). In a photo

PIG. 5.—COMBINATIONS OF LENGTS FOR RAFID PROTOGRAPHIC WORK.

for the portrayal of a comet, for Instance, as short expectures as possible are desired, and this calls for an great a ratio of appricar to focal heapth as possi-ated to the standard of the tags of the standard of the sta

field from a lens with an aperture of 1 δ is impossible with only two lenses; three or more are necessary Using gains of different indices of retraction on the control of the control o

Every skiliful amateur knows how to test a photo-graphic lens. This is perhaps done as well as any other way by the test cards for artigmatism, to see

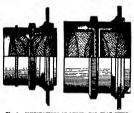

Fig 6 -- COMBINATIONS OF LENSES FOR FLAT FIELD AND ABBRECE OF COLOR.

If straight lines which intersect at right angles be-come lines or blurred images at the edge of the field. Still a lens might answer all the requirements for ary camera work but be a poor astronomical le A camera might cut clear to the edge of the plate on ordinary work, but when a three or four-hour ex-posure is given on stars all imperfections will show up Unfortunately, for obtaining astronomical photographs a telescope mounting with a good driving clock is indispensable—which is usually out of the reach of most amatours

On the other hand there are a number of small vis

On the other hand there are a number of small via usal telescopes in the bands of ansaturs, and a few words might be said in regard to testing thom. This is best done on a moderately bright star. Fous car-fully on it. Push, the cycylice in slowly and note the fully on it runs, the species in a source of light does not remain circular, the objective is not "squared on properly, or the objective may be pinched in its reli This must be adjusted before anything more is done Now pushing the eyepiece in, the colors should

T -- WORK OF A RECTILIBEAR LENS COMPARED WITH AN AMASTICMAT BLURRING DUE TO ANTIGMATION IN RECTILIBEAR LENS. Fig 7

change gradually and symmetrically as the disk of light enlarges. The same should hold true by pull ing the expelsee outside the focus. If the telescope behaves well from this test, turn to a double star behaves well from the test, up to a counter sac like Castor As the amateur becomes familiar with the heavens, be will soon learn test objects for his telescope, and if he possesses a good instrument there is no keener pleasure than trying it algula after night and becoming familiar with the beauties of the heav-

POWDER PLATING OF METALS.

Before a meeting of the Royal Society of Aris, in London last January, a paper was read on an im-proved method of electro-plating it described the process of plating metals by rubbing them with a moistened powder, and a number of articles work The new plating powders are not to be confused with plating preparations which have been in use heretofore plating preparations which have been in use an exectors and which set merely to exchange the surface metal of the article to be plated with a thin film of deposited metal. In the new process a truly electroly, it action takes place which results in the deposit of metal without taking away the surface metal from the object to be coated Furthermore the deposit may the object to be coated. Furthermore the deposit may be made as thick as desired by continued applications of the powder. The inventor of this plaining powder began his experiments a number of years age, so with a view to developing a process by which knives first symons and the fifte can be plated as results as they can be cleaned with policiting powders, and he sue models in deviating a nuclear by which almost any metal and even certain alloys such as brass in various proportions of copper and sine can be applied to metal objects. Bo far the new powders are not n the mar-ket in this country but in England they are sold in small cans for a shilling each and one can is suffi-cient to plate the nickeld portions of a hicycle or to

ant to plate the nickeled portions or a management at a quantity of houselold silverware.

The powders are comjos d (1) of the motat to be motated to be motated to be motated to be motated to be motated. diposited in its of mentary state (2) of a salt pre f rable a sait of ammonia and (3) of a powdered f rably a sait of ammonis and (3) of a powdered metal which iss it to d positre to the metal which is to d positred. Magnesium is the most letro positive metal with it is commercially prac-itivation use and in narv of the preparations attun-forrs is a tive to it il ment in asome of the prap-arations atuminium and sine are used. The follow into formula travet the size platting powder.

/Inc	I' parts by weight
Ammonium suiphate	5 parts by weight
Magnesium	1 part hy weigh
Chaik	10 parts by weigh
Scapstone	2 Γ parts by weight

Ordinary comm relatizing dust oven though it is not perfectly pure may be used. This same formula may be used for my rai oth ; metals if sliver be substituted for the zinc in this formula a very heavy substituted for the sine in this formula a very heavy deposit will be obtained which will have the white frosted appearance of allver electroptating before the problem of the substitution of the size the deposit will be a light-yellow but various shades down much the state of the size of the posit will be a light-yellow but various shades down routs. The entite which is to be plated with the powder does not have to be cleaned before the powder and ilberates the oxygen of an oxidized aurinous. The entitle who while the oxygen of an oxidized aurinous for the size of
MAKING MILK ARTIFICIALLY

ST 1 / AREAS

We have heard so much about the synthelic production of performes syrups dyes and what not from coal tar products that we are not easily surprised by coal tar products that we are not easily surprised by the information that milk may be artif faily made. The m thod described below however is not a chemi cal one hut consists merely in the mechani al admix ture of distilled water with crushed and finely ground sweet almonds Practically the only difference be tween cows milk and that made of almonds is that cows milk contains animal casein while the artificial cowe milk contains animal casefu while the artificial milk contains repertable seator. The inter will produce a good supply of cream and if allowed to stand some time will become sour it may also be cased lated by the addition of vinegar or scelle acid. When combined with grape sugar it is capable of grounding some extenordinary organic substances. The artificial milks who have different to the same way that cove a milk is used.

way the cow a milk is used. To make the milk protuce half a pound of sweet simends—the Valencia which is cheaper than the Jor dan aimond will give just as good results. The skin of the aimonds may be removed by scalding the nut in boiling water and pevling them with a sharp knife. The aimonds should then be placed in a wooden they plug bowl and chopped as nively as possibly. Take about two ounces of the chopy of aimonds and plack. them in a mortar with a small quantity of distilled them in a mortar with a small quantity of distilled

THE ARROPLANE AND THE DIRIGIBLE

all the history of mechanical achievement it would be different to find a parallel to the comwould be difficult to find a parallel to the com-bination of the lilipower and andmity with which as few man is as it we years, have illied the art-in flying Front the dreamins, of the Impractical ex-tinated into the world of brilliant accomplishment It was not so very long since that a scientist of world-wish reputation attempted to prove that because of ranni fundamental principles the art of fight by means of heater than air machines was not tam merilally practicable Nevertheless within a period mercially practicable Nevertheless within a period of considerably less than a year, more than one avi-sion has flown at a speed of over forty seven miles un hour, unother has covered a distance of 144 miles in a continuous dight of four and a quarter hours, a third bas flown across the English Channel, and a fourth Paulian, the most distinguished a later of them all has sourced nearly a mile into the air and finally has surpassed over that fall to dying London lo Manchester covering a distance of 186 miles, with but one stop for fuel, at an average speed

of over forty miles an hour
The significance of this realty wonderful race b tween Paulian the Frenchman, and While, the Englishman is apparent only when we consider some of the details which have been cabled to this side of the That Paulhan should have wen the \$50 000 prize in such superh style at the very first trial is tribute both to his own skill in manipulation and to the excellence of the Parman biplane with which tho race was won, but to appreciate the full significance of the race, we must remember that both or and particularly White flew for a considerable stretch of the journey at night time and what is of even more importance that they did not healtate to make both the assent and the descent in the darkness. No stronger evidence than this could be afforded that the according is an instrument of mecision which can be relied upon to answer with certainty to the control line hand of the merster

is something strongly suggestive of bird flight in the description of the manner in which one the contestants after leaving the ground swept through the air in a wide thele in order to get the my of the land and the proper direction of flight or to p'(k up again a course from which he had been driven by the wind But certain) the most difficult feat of all was that of making a landing at night time in a forality with which the aviator was quite max-qualored and where he had to make a wide delour looking for a suitable stretch of unobstructed surface

Last year in commenting open the status of the art of flying we pointed an that the one last obstacle the provided achievements was that of successful starting and alighting upon the average surface which would be encountered in cross-constry flying and per forming these feats with certainty in a breeze of or dinary strength The London lo-Manchesier race would certainly seem to prove that this important stage in the development of human flight has been

age in the development of number right has used ached and successfully passed In strong contrast to these achievements of the seropisne is the series of disasters to airabips, culmin ating in the wrecking of the huge dirigible "Zeppellu which have occurred during the last few w Although the dirigible has proved to be perfectly stable and to possess the ability to fight his way against ainds of considerable strength the late disasters and notably the wrecking of the "Zeppelin" emphasize

Scientific American

the fact that, whenever these buge and delicate fabrics week or are in contact with the ground they are a imminent danger of destruction in this resi they are in the same class as the ocean steamship, whose captain cares little what winds may blow, when once he is well clear of the land with everywhere deep water below his keel, but whose anxieties in-crease in proportion as the water shoals, and the ves-

sel again spproaches the coast line

The perit of the dirigible lies in its buge bulk and The peril of the dirigible lies in its ouge outs and the great area which it exposes to the presare of the wind These elements, it is true, are not a source of so much danger when once the craft is well clear of the earth and has abundance of what the navi attor aculd call 'sea room in which to maneuver, but when it comes to the question of making a land ing, and so long as the airably is upon the surface of the ground is an unprotected position, as she must needs fromently be the dangers of disablement and even of complete disaster are ever present remember how the accumulated promure of the wind on the French airship "Patrie tore it toose from the siddlers who were frantically endeavoring to hold it down to earth and carried it over the English Chan-nel and scross Ireland to be lost in the ocean beyond nel and serous freind to be lost in the orean neword 80 too in this later disaster, the "Zeppelin," during an enforced landing, was caught in an increasing wind in which is was only a question of time before tha pressure proved too atrong for the cumpany of infantry that was endeavoring to hold the strahly

Of manner, in the place of the place wind pressure on large structures runs up to enormous figure. The designers of bridges make province of thirty pounds on mous figure. The designers of bridges make provi sion for a maximum pressure of thirty pounds on every square foot of surface. If we apply this unit of pressure to the Leppeltin' we find that on a plane of pressure to the Zoppetth' we had that on a plane warfare represented by the total length of 446 feet and the diameter of about 40 feet, plus the area of the cars, rudders etc, the pressure would amount to about 230 fons, and if we admit that the effective ressure due to the dirular shape of the gas bag would be only about one-half of this there would atili be a strain of 125 ions upon the guy ropes etc, by which the machine was held in position if we include the take Constance disasters, this is

the third or fourth wrecking of a Zappelin dirig by its being dashed to ideces in stormy weather after making a landing and the moral is that these ships of the air should remain as far as possible per manents affect tring up when they wish to make a stop, lo infty steel mooring lowers, which they must approach end id, and to which they must make fast by cables from the bow. This we believe, is the plan which Z-ppelin himself proposes to follow, and it would regiainly seem to be the only arrangement that offers security sgainst absolute shipwreck

THE DECLINE OF THE HUIVERSITY IN SCIENTIFIC RESEARCH

O many valuable discoveries and researchs are now due to scientific institutions under soverament control or founded and support ed by private munificence for specific purposes that the question arises is it not to such agentless rather than to the universities and colleges that we must took for the most active progress is future original scientific lavestigation?

Not only are these institutions for special research froed from the duty and cares of teaching but what is of greater importance, their organiza-Every possible assistance to rendered to the individual tigator, and he in turn is carefully selected f his proficiency and promise and with ample facility ties at his disposal and supplied with an adequa salary, he is expected to work systematically along certain definite lines with entire freedom from finan cial or administrative concern

At the head of these institutions there are usually directors who are men not only of eminence in their special science but competent to organize and con duct campaigus of scientific research, which may quet campangua in scientific research, which may include a number of workers often in widely different fields, yet all capaged in studies merging into one definite wheme Each worker receives full credit for his particular contribution, and the solution of great and romplex problems is undertaken with all the efficiency of organization and co-operation char asterists of the best and most modern industrial and commercial practice Yet there is no sacrifice of the true scientific spirit and the only elements of the commercial spirit and the only squantial of the commercial world that are applied are economy of effort and resource, efficiency of organization, and adequate capital and plant to push to a satisfactory optrome any particular project or class of Investigation

investigation
These conditions have attracted many investigators of reputation, and in such scientific establishments as the various laboratories of the Carnegia foatitution of Washington in Rocketeller Institute for Vedical Research and the research inhoratories of manufacturers' associations and large corporations.

not to mention those conduct auspices, much scientific works is done. One might refer to is done. One might refer to es, to national physical and bureaus of weights and mical observatories and biological mical observatories and biologisal seums and matorological observe every case there would be found ord of scientific activity. They may be a second of the contract and is often imports and in its application to the second menits

With this over increasing efficiency on the special research institutions, we see broader face with the fact that no longer are Assertitis col-leges and universities with their various addutifilayer and universities with their various substitutes to hook and ishoratories in a speed a publican to forward selectific research as of yeld. See five-cases there are speed and onlyments with a vigorical variety of the control of ciliacs where there introduction interference from coverning boards and substitute from the control of t lites for modern reserveb, nor is the appendixed as the act of make it is procuration; markles the make conditions of evoponile will leave the season of the work of the great American assessment; that its dipartiments cover at least in theory, and interest aby wide range of knowledge and as well as the forthelf support appropriations none of the mark must be granted by administrations and process the season without any exact and meetal known of the season of t hindgets of such an organization, with fined field the governors of a university, by the intricacy of the situation as well as the mag-nitude usually adopt a policy of averaging the sp-propriations to different departments rather than of suming the responsibility of passing on the

or urgenty of their work But important as are material support and facili-ties to modern research, this is by no means the only or most serious question for the main of gautins triumphs oventually over the difficulties due to their triumples overtually over the difficultier-due to their measure. So catcaded have American underweather revertly become, both in scope and nations do inside the intent toot invente toot invente and and in the desire for large registration that an executive head of the university demands from his executive near or the university demands reess are staff as a condition of usiary advance or promo-tion, the greatest possible amount of teaching, be it congenial or not Under such conditions it is not difficult to see that the lime and inclination for (Onsenia) or nol special investigation and research by a young scien occupying a university curtailed Furthermore, so intricate is modern uni-versity mechanism and even minor administration that from a professor there is required an ever-inversity mechanism and awah initior administrations that from a professor there is required an ever-tivessing amount of clerical labor in the composition of statistical and other records, and information about, sutdents and departmental information about, sutdents and departmental information about, sutdents and department of the composition which today is and to initiate commercial formation which today is and to initiate commercial formation which is a substantial information and initiate commercial formation and initiate commercial formation and initiate of the professor function and initiate of the professor function and initiate of the professor function and initiate comparison with their Ecoposan collections. This condition, university presidents and tractors in a comparison with their Ecoposan collections. This condition, university presidents and tractors in a comparison with their Ecoposan collections. This condition, university presidents and through the condition, university presidents and through the condition, university presidents and through the condition, university presidents and tractors for insulation and the condition of great and further endowments for insulation and collections are considered as a support of the condition of great and further under a condition of great and further under a condition of great and further endowments. when applied to special institutions apart free cational machinery. It must not be understoo the training of young men for the training of young men for scientific rise, by hea experienced any also kning of effort in our, versities and technical schools for it is these spread stimulated as never before by their proteomy, such will hear forward the torch of scientific progress, Education and original disovery seem destined in the the future to be cárried on by totally distinct ar-vanitations.

That the silver area in northern Ontario is confially being widened in originated by the discounty of antive metal about fifty miles west of Cochrant on the Grand Trunk Pacific. It is understood that the discovery was made in blasting out a railway out when the news reached Cookrane, sixty prospectors started out the next morning and this number is be-ing constantly augmented by fresh arrivals.

Scientific American

AERORAUTICS.

Mr. A. L. Pfitaner has been making successful flights with his noval monoplane (which was illustrated in any insue of February 18th) of late in various places On April 15th he made three successful short flights at the April 18th he made three successful short nights at the Buffalo Country Citch, and in the fourth flight be rise across the field at a high rate of speed, rising to a height of ten or twelve feet, when a gust of wind struck the machine and drove it to the ground with great force. The aviator was braised and badly shaken such and his machine was more or less seriously dam-aged. Despite his accident, Mr Pfitzner has demon-strated that bis novel sliding wing tips work well

Missers. As Merring and W S Burgess have been expurimenting with the former's new biplane on Plan Himsel, opposite Newburyport, Mass. This new ma china, which was illustrated in our issue of March 1998, has demonstrated that it can elide over the nessed and rise from its single skid without the use 2 Wissels. On April 17th, Mr Herring made a short fight of about 250 yards. On the 21st he made three shibs flights, in the longest of which he covered about \$\sqrt{2}\sqrt{ y 8 Curtis, while flying the machine at an of height of thirty feet, lost control of it eded and struck the ground head on, a soft meadow. It was badly smashed. stely in a soft mead the aviator was not injured

Wills swistion advances by leaps and bounds, zero-statish has had several serious setbacks of into To begin with, on April 3rd the Germen bettoon "Pom-merts," celebrated for baving won the Bonnett cup mers, celebrated for baving won the Bennett cup race in America in 1908, fell into the Baitle Sea and three of its four occupants—one, Herr Deibrick, a member of the Reichstag—were drowned The next day, Front Abegg, a well-known German chemist, was killed while making a landing, while on the 18th ulti mo the balloon "Delitusch" carrying four men hurst during a thunder storm while at a height of several d feet, all its occupants being killed by th thousand feet, an its occupants owing street up the fall. It was at first supposed that the balloon was struck by lightning, but this was afterward found not to be the case Emperor William, however, has had a thorough investigation made and is getting together all the facts regarding the igniting of the gas in balloons by atmospheric electricity

As far as dirigible balloone are concerned, German which for some time past has been in the lead with this form of air craft, has also suffered severely 46 After making various cruises in the vicinity of Co-legas, the "Zeppelin II" "Gross II," and "Parseval I isgus, the "Zoppello II" "Gross II," and "Farseval I alraktigs few from that city to Hombner on April 21 and and were reviewed by Emperor William As a gasteng up, the stribble were morred at Homburg over algabt. As strong winds continued, the 'Gross II' which is a non-rigid diricible) was defacted and ahipped back by rail. The "Parseval" and "Zoppelin" lit attempted to make the return journey, but only the former was essensitud in accomplishing it. The "Zappelin" lost gas and was forced to descend at Lim barg, where it was moored again over night, and fully inflated in the morning. At noon a sudden squall of wind tore the bugs dirightle from its moorings and it floated off without a rew. A haif hour later it was driven to the ground at Weilburg It. fell beside a cliff and broke in two The andden demolishment of this, the principal airship of the German floet, bas shown how precarious is the existence of these leviathans of the air

On April 21st Prof John J Montgomery, of Santa Clara College, Santa Clara, Cal, lectured before the Aeronantical Society in New York upon his aeroplane Aeronantical Society in New York upon his seroplane experiments. These were beginn in 1853, and Prof Montgomery met with no little encreas from the start Arter fart trying a fapping-wing methion, he has held in a monoplane gitder having wings 10 by 4% feet in sake, and patterned farter the wings of a guil, e, with a dewnward curve in front. Upon running down hill with his first glider, he rows and giffed 600 yards. He with this first gitler, he rose and giffed 600 yards. He sessered and maintained equilibrium by leaning his body to one side or the other. He next endeavore the sessure better control, and to this end studied the birds closely. He was able to determine just how they warp their wings. Then he built ceveral machines with warpable vings resembling a first wing the studies of the session of the se evelved a Langley-type warpable glifler having curved surfaces and a fixed vertical tail (in conjunction with surfaces and a faced verticul tail (in conjunction with a inorwhis horizontal tail) that worked epinedidy, and that could be steered simply by warping the wings. This mackine, piloted by Daniel Maloney, what cut loose from a belloon at heights of 1,000 to 8,000 feet, and the avistor was able to glot a landing place and alight wherever he pleased. Prof Montgomery secured a U. S. patent (No. 321,172) on new bamber 18th, 1908, and in view of his practical demon struction of steering without the use of a vertical rand secured a U. S. patent (No. 881,173) on Sep. der, it would seem that this rudder is not as one

ELECTRICITY

The Subway Telephone Construction Company of Chicago has promised to provide that city with a complete eutomatic telephone system by the first of June next year At first it will cover only the business district, but leter will be extended to the residential sections.

Merchants in the South bave awakened to the valus of rural telephone lines, and are seeking to develop them, with a view to increasing their trade emong the rural population. In certain sections they have made large contributions to aid the farmers in building their lines.

The Westher Bureen has erranged to give daily weather forecasts by telephone to farmers in Texas At noon each day rural subscribers ere called up, and the weather forecast is ennour and the executer rorecast is ennounced to ell simultaneously. Subscribers in towns and cities can obtain the weather forecast at any time of the day after 11 A. M by calling up central

A writer in Physikalische Zeitschrift has been in-A writer in Physicalische Zeitschrift has been in-vestigating the frequency of electrical oscillations when a condenser is discharged through a spark gap He finds that this depends to a large exten-on the nature of the electrodes. For instance, a on the nature of the electrodes. For instance, as discharge between copper and silver electrodes would give a longer wave isngth than a spark between magnesium electrodes, and he comes to the conjuston their magnesium is the most suitable metal for enerk electrodes

A new system of jointing lead cables has been developed in England. It consists in placing a thin ribbon of pure tin between the surfaces that are lo joined, end then heating them with a blow lamp. The surfaces in the presence of the tin m lower temperature than normal, and thus they are soldered together. The tin ribbon is treated with a composition to prevent exidation during heating a composition to prevent oxidation during heating.

Another system of jointing coasists in the application of a mold over the cable. A piece of tin ribbon is applied to the surfaces which ree to be joined, and then moltes lead in poured into the mold. The flow is so directed as not to burn through the lead beething of the cal

The fourteen-year-old president of the Junior Wireless Glub of America appeared before the Stuato Committee on Commerce last week to protest against the bill introduced by Seastor Depew for regulating wireless telegraphy The young president gave a very fortible argument in favor of amoteur wireless very fortible argument in rayor of anioccur wireigns telegraph operators, pointing out the fact that if the bill were passed it would check the inventive grains of some forty thousand experimenters lie also called attention to the fact that it would be impo cained attention to the fact that it would be impos-able to enforce the bill without a verifable ermy of export wireless telegraph engineers. The junior wire-less telegraphere claim that it is possible to cut out interference if the proper apparatus is used, and that the present attack on amateur wireless telegraphers.

The Third Avenue Raliroad Company of New York tried out has winter a gasoline-sieviti cer or its crosstown lines. Now another type of cer is bing tried, and a comparison will be made of the two The new car is a reconstructed horse car product with Gould storage batteries and a pair of two horse-power motors. The battery is pinced under the reats of the car and has a rating of 420 ampere-hours at \$4 voits it is made up of twesty-nine plains per cell, and there are forty-four cells at each side of the car. The gauses that are generated by the balthe car The gases that are generated by the bat tery are carried off by a ventlinting system and ex ansat under the rear platform. The car weights only eix tons fully leaded. It has been found to consume in actual service only 054 wet hour per ton mile, while maintaining a speed of six miles per hour with nine stops per mile.

The steel hull of a vessel is rendered magnetic during construction by the hammering of the metal, and every etect vessel has to have its company cor-rected to counteract its own magnetic lines of force agnetic influence is further complicated by the load carried by the vessel if this load is marnetic or load carried by the vessel if this load is magnetic or capable of being magnetised. The ore-carrying ves-sels of the Great Lakes experience great difficulty on this account, and the United States Hydrographic Sureau is endeavoring to teach pilots and captains of vessels plying in this trade how to check their course by means of the pelorus. The pelorus is an ent similar to the sun diel, being p with a gnomon end a graduated are on which a shadow of the gnomon is east. The instrument is set in a north and south direction, as indicated by the compass, and then by noting the shadow on the graduated are, it is possible to tell by comparison with tables, furnished by the government, just how far from the north and south position the gnomen really lies, thus showing the compass error

The Land of Helley a Comet and Popular Apure benations' for diribution throughout the isleuds with the object of reassuring the natives, who, it is said, are aiready a prey to many wlid rumors on this subject

The American Philosophical Society of Philadelphia has decided to assist in the movement for an expedi-tion for south pole exploration. The project was urged in 1909, when the following scientific ascieties united in 1909, when the colorwing weight assured united in an appeal in Congress. The American Academy of Aris and Sciences American Georgiphical Society California Academy of Sciences, New York Academy of Sciences, Franklin Institute, Geographical Society of Philadelphia. American Museum of Natural Sciences, Geological Society of America Association of American Geographers and the American Alpine

In a le delivered before the Royal Society of Naples Prof A Piuti called attention to the discovery by Paimicri in 1881 of a characteristic line of ery by Faimitri in 1881 of a characteristic line of hellinn in the fame spectrum obtained by heating in a flame 'an amorphous, buttery substance of a yellow color which was found as a sublimate on the edge of a fumerolo near the mouth of Vesavina' This is generally accepted as the first discovery of terrestrial bellum, eithough Nasini and Andelini in 1806, on ex-emining the flame spectrum of a large number of vol cante increasistions fatled to recognize the presence of helium in any of the specimens they examined und the condition described by Paimjeri

The Express of London claims that another word must be added to the dictionary of gardening. This is 'Csioriculture' the name of an entirely new system of horticulture which has revenly been inaugur ated, end bids fair not only to replace the form of intensive culture of the French school, but to revolu the present system of fruit and vegetable force ing While it is nearly customary to look for extreme and favorable developments in the line of soil cuit vetion, through French means, to us in the United States, who have not the garden habit quite so atrobaly as obtains in France it comes as a surprise that the inventor of the new method is a Briton Dr F Alexander Barton, is liow of the Royal Society

For the last year systematic excavations have b made at Ostia, the ancient harbor of Rome at the mouth of the Tiber The ruins of a large city built mouth of the Tiber The ruins of a large city butti probably by Hedrian over the old republican town, have been uncovered. Archeologists consider the dis-coveries as important as those of Fompell. Heretofore It has been believed that Ostia was founded by Ancus the fourth King of Rome that it stroved by Marine during the chill were rebellt dur ing the republic sank into liesignificance, and was buried to the sand and deposited in the Tiber when Trajan built the new port and city of Portos of this it is now certain that Ostia not only continued to flourish under Hadrian but that the old level was raised six feet and that the republican town served as the foundation for a model city with rectangular wide streets, temples fora and squares

A case of extraordinary if not unprecedented hori al temperature gradient is reported on apparently golial temperature gradient is reported on appearance trustworthy sotherity in the Meteorologisch. Zeit-schrift for March 1910 With a temperature ranging between 0 dog and 4-2 deg C at II intentiors Finland on November 18th, 1909 a temperature of 20 deg to 24 deg C was simultaneously recorded at a point only 10 kilometers distant to the north, a difference of shout 20 deg C (68 deg F) in a distance of about 8 miles the climate at Heisingfors is tempered by the Guif of Finland so remerkable a difference between the temperature there and in the immediate hinteriand is inexplicable capecially as the two stations at which observations were made are of the same attitude The observations were made are of the agms altitude. The strangest part of the story, however remains to be told viz., that a little in the north of the place where the low temperature was reported the weather was almost as warm as in itselingfors!

THE NICE AVIATION MEE

WITH DETAILS OF THE CROSS-COUNTRY RACE FOR THE LONDON DAILY MAIL'S \$50,000 PRIZE

One of the principal aviating meetings which has been held abroad this year was that at Nice from April 15th to 25th Two of our illustrations show Purnum hiplanes that participated in this meeting. The one in light over the sea was pitted by During, an old time automobile rating driver, while the one an old line automobile rating driver, while the one which is shown on the bach was piloted by George thruz. Chaves on the 17th uttime accomplished several long flights above the sea. In one of these the gave out and the machine landed on the beach. as shown The meet opened under auspicious weather conditions and some spiendid flights

were made on the opening day A planes and a Bieriot monoplane were all in the air at the same time Effinof Chaves and Van den Born, all of whom flew Farman biplanes made some excellent flights. Rougler also The results of the first day's flights in the various contests were as follows

contests were as follows

Total Distance Prime — Edimof (Farman biplane).

130 718 kilometers (81 17 miles) Chaves (Farman biplane), 105 508 kilometers (85 28 miles). Van den Born (Farman biplane), 87 508 kilometers (84 14 miles) Meirot (Volain biplane), 15 kilometers (84 14 miles)

This competition was for the total distances flown in all flights made during the day by each competitor Harting Prise, Without Passenger,—Efficient

to Manchester, England, on the 27th and 28th ultimit for the prise of \$50,000 offered three years ago by the London Daily Mail. On April 23rd Mr. Claude Gra-London Daily Mail. On April Strd Mr. Chause of hame White, an Bagishman, attempted the flight his Farman biplane. After covering the 115 miles Litchfield in 3 hours and 6 minutes, he quit bettly with the violent wind and the cold. The next is with the violent wind and the cold The seat his acropiane was heldy damaged by the wind W in its (susperary shelter. It was taken apart shipped back to London for repairs. Meanwhile atter Louis Paulhan wisted London and entered row France on April 1810. The state of the State o

ately to Hampstead (5 miles London) and croming the st tine at 5 31 He had a will to his waist, and he will made brilliant flights, on one occasion

crossing the Var. and another time flying haif a ndie out to sea Metrot flew for haif an hour on his Voisin bipinne, and Olicalagers made sev ral short flights in his Hisriot mon plane which appeared to interest the spectators more than the biplanes on account of its bird like appearance The English entrants in this meet Mesers Rawlinson and Rolls, were unfortunate. The first named was unable to its more than half way around the track the first day on ac-

around in track the first day on ac-count of trouble with bis Darracq mator which he was using on his Henry Farman biplane white Mr Rolls did not receive his Wright biplane from England

his Wright biplane from England
The second day of the meet nearly all the aviators
made excellent flights. Herr Grades monoplane
failed to arrive and so be did not participals in the
slights. Riffmoff made a flight of 80% milles, and Vha
den libra in vol miles. Mr Rawlinson made a daring flight out to see a White turning above the water,
he was apprached too tooley by 25mmoff, the result
being that although the two aerophanes did not toughaccord other. Mr Rawlinson's full into the see, and was
except of the seed

MULIAR STRAL ARCH OF THE SERIES STOW ROOF

There is a type of dome that can be built without a scaffolding and that requires a man to be immured within the vault to issure proper construction. It is the invention and soil property of that most ingenious the investment and some property of their must ingentum of savage races, the Sekimo and contains several prin ofnice new to civilized architecture

objass new to divinised architecture.

There are four fundamental types of arch and dome, of which one is the Eskimo poculiarity. The simplest and least used, because least effective is of the simple shault of the control of the co issants type—Histrated by and to-day chiefly em ployed for, the house of cards. Next comes the false inverted-step arch where each block or brick projects inverted the one below and is held from toppling in by the weight of the material above and behind it This type of gateway and chamber was invented inde pendently by the architects of Agamemnon more than pendently by the architects of Agamembon more us 2,860 years ago in ancient Orecce and the precurso of the Astees in Mexico at nearly as early a perio This construction inharmity demands a vast amou making or fill in proportion to the vault of the

area it is reasine for a gate in a jong ea-an underground hall or drain but cannot stand alone and is a faire orth. A free por-tal, or a dome rising into the air cannot be tal, or a dome rising into the air cannot be built on this principle which is consequently but little employed to-day Our true arch tune being the use of wedge-shaped blocks tune being the use of wedge-shaped blocks. When the last and contral one of these piece—the key stone—the dropped into place the whole mass supports itself. The top cannot fall inward unless the supports are toppled outward. The primary thrust is therefore al ways not in but out and buttressing of son ways not in but out and buttressing of some sort is requisite. Another inherent defect of this arch though we are so accusiomed to it that we do not usually note the fact is that until the key stone is fitted into final position a temporary structure must be rected to hold up the parts already in place. The last type the Eskimo vault is a truo dome exerts no outward ihrust and requires no temporary

outward threat and requires no temperary scandiding it is also unique to that its ma terial is not brick or stone but sense. The construction is used for the bechive-shaped winter houses of these so-called savages and is upital in plan as shown by the disgrams. A row of blocks is first laid on the ground in a circle—or more creatity a polygon. Buch of these has a slightly sint top, and cay the tree of these three controls are the controls and the controls are t

raises its surface a little beyond the last until when the circle is completed the gap in height between the last and first blocks gives the thickness for the see man and true mocks gives the thickness for the following courses. In these the upper and lower sur faces of each block are parallal as in a brick but the gradual upward trend given by the first course is of necessity maintained.

In each successive round the snow bricks are les inward more by having their lower surfaces sliced of to a Bevel If set squarely end to end they would before long lean inward so far that they would tum ble For this reason the end of the block last laid is ble For this reason the end of the block hast taid is out at an angle. The next following block has the joining end slanted at the reverse angle Thus it fits in behind the preceding and is prevented by it fits in behind the preceding and from slipping inward. As the house

grows the circles become smaller until at last only an irregular polygonal opening is left. This is filled with a wedge-shaped block cut to shape It is however not a key stone as the remainder of the

tructure supports itself

The blocks of firm snow are usu
ally dressed outside and handed lacing to the man on the in The last block he holds np with one hand slices to shape with his ivory knife in the other, and his ivory mire in the closer, and drops into position. He is then entirely inclosed in the want. Only after the house itself is entirely completed does he cut out the low r, which to keep out the cold as much as possible is only big enough to crawl through A long low tunnel is then built in front of the deor, to break the force of the Arctic's loy blasts Even a window is present A small aper ture is cut out over the door and turs is cut out over the door and filled with a pane of clear this ice All that is emitted is the Size or chimney Whatever heat is pro-cued by the seal-oil langue is wanted inside, warmth being a mapes serious necessity in the cil major in the cil major the cil major their conWhether the type is practicable in other materials has been doubted. The unsurpassed lightness of snow is certainly a great advantage. In heavier materials ngth would, however, compensate for increased

Plan view of partly built but, showing how each bi

rtly built. The snow blocks are laid in a continuous spiral course

Section through Polices upon hon-THE PROULIAR SPIRAL ARCH OF THE ESKING SHOW HOUSE

for the inward slipping tendency that weightier ma tarials would show The greatest difficulty in working in ston The greatest difficulty in working in ston would be encountered in shaping the separate pieces of ma sonry Owing to the spiral and leaning construction no two blocks can be exactly alike in either shale of

ire and in every succeeding course catch block de parts more and more from the right angle in its pro-portions. To compute in advance exactly the print ranging for each piece so as to insure true bints would be a matter of much complex mathematical realculation

It might however be practicable once the cal da

It might however be practicable only the call its flone had been determined for a building of standard size to draw up a table of the angles and dimensions required for each successive block. If the size of the structure were reduced or increased from the stand

ard each stone would only require to be diminished or anlarged by a fixed ratio.

It would take our aliest engineers longer to pian such a dome than an hakimo would not to build a willage, but the remitting simplicity of construction due to the leavitableness and simplicity of the prox reas of crection without any temporary supports but treases or reinforcement might more than compen

The spirally ascending bevellocking Fakimo dos is the only true vauit any part or the whole of which will stand entirely by Itaelf

A GAMELINE MOTOR RETURN PARCEL MARRIED MARRIED BY WAITER LAN PURD

The details of construction and method of operation The details of construction and method of operation of a unique gasolin motor-driven earth boring ma-chine are shown in the accompanying illustration in device was recently designed in california by Charles I Belly and the photograph represents it in working position in actual operation at Sacram nic

It is stated that with one of these machines about 25 miles of holes were bored for use in fenc ing along the right-of way of the Western Pacific Rallicad between Maryaville and Oro ville (a) These holes were bored under ville (al These holes were bored unner particularly trying conditions as the ground was gumbo land with the exception of a short streich of nursub soil and so bard and so dry that every bit of it had to be broken with it k and crowber when dug by hand in addition to the hard ground had about 20 to 2" per cent small cobble yet this labor saving devi e bored through all of it and did the work of from twoive to fifteen

> Such a mathing is of great value for hor ing bols for less for numerous other uses for whith shallow hols are required and for the jurjos of lightening the labors of Experience above that the harder the ground and the more difficult it is to work the more amostly a machine of this class is desired

This entirely new unique and practical en gine driven apparetus is a most remarkable device in its simplifity and owing to the wife range of us a sea labor savir it slands on surpassed. It will be seen that it is ex

surpassed II will be seen that it is one to make surpassed in which and cutterly fractual and will be found a great a commit r of time and money where post holes are to be dug electric line. It is task but I kephus poles set or where treas and have an another treas and the passed by the service of surface are to be planted in books uniform in size at top and be from and of suitable diameter and depth.

It is held to be practical for use everywhere as by est the machine will work satisfs trylly in either dry I at the machine will work satisfa trily in either dry cl wet sell or in any place wher the machine an be driven as it beres readily through insignan and shale oft aradatons and small cobile and as it will bore at different angles and on either wide or back of the truck it will do equally good work whether on level

ar Redley (al a great number of holes or hord in very hard hardpan for large poles the

ma hin being particularly successful in this work be-cause the contrast between its effi-ciency and hand labor was so strongly marked At Mendota Cal a record was made by one of these machines on largo fen + work in hard dry earth 90 holes being bored "3 fe t apart and 30 inche deep in 60 couses the minut a the

holes I lng 8 in h s in diam ter For use in boring small holes a rikal engine of the double cylin r type is utilized that develops 7½ horse pow r In boring holes for large poles a machine of this type is fitted with an 18 lach auger effecting a depth of 64 feet power is supplied in this case by a double cylinder gas line engine of 12 horse-jower cats ity

Is norse-jower cat a lly

Fills device is said to be inex

p many to operat as a man and a

boy only are required for its efficient
working the boy to drive the team and the man to manage the ma chine its not earning capacity is said to be greater than that of a threshing machine costing fiv-tines as much its mason of us-fulness extends over the enti-year and in many instances in year and in many instances in hard ground has done th work of

It is maintained that in cold countries where other farm work

WHERE PRESENT OF SARYS-DUMING MARRIES ASAST TO ROSE A MOLE.

is impractical during the severe season, post holes can be dug and fonces built during the winter, as tith is well adapted to boring through its, frozen ground, hardenn, shale and the like

in the planting of orange trees peach trees, grape vines or in having a piece of land undertaid with hard pan in which holes for any purpose are expensive to dig this form of machine will do the work of making opening through any crust for the top root of

The unper frame and boring tower being on a ro intable platform, one can easily adjust the machina in a hole on either side or at the rear of the machine when the device is in a position to have a hole, all that it is necessary to do is to pull the feed clutch, and that it is necessary to do is to punt the reed clutch, and the auger drops to the ground and begins work, when the auger is londed, by releasing the feed clutch and pulling the hoist clutch in, the auger is hoisted clear of the ground, or to any other position that may be destred

It is of interest to note that besides boring in the kinds of soil before mentioned the machine will bore in dry clay, or in swamp land without any change of augres or idis no ground being too sticky for it to There is no necessity of stopping the machine to clean mud off the anger as the machine does that Hunte

if there is an occasion to hore a line of heles down the middle of a well traveled road it will do the work without difficulty. A small type of earth boring ma 4 fert and which is equipped with twe augere 8 and 12 inches in diameter, white a larger machine has been developed which will hole to a depth of 8 feet The latter is fitted with three augers 8, 12, and 16 inches in dismeter

inches in diameter
It is stated that no change of shaft or auger is required to make the depth indicated. The time required to more from one hole to another and bogin work in a fence line is from 15 to 25 seconds.

The freq liption of the unachine see well as in he food rack, drill shaff genering, and auger shaft are middle of cruelibe and muchin; y etcel so as to withstand a

sudden impact as when stopped by running against ricks, old posts and similar obstacles

rocks, old posts and sensing conductes.

Chain beiling is used of the slaudard sprocket type
and in case of a break can be easily replaced. It will
be seen that this machine in boring does not scope
the earth but cuts it with thisel bits, which are quickly detachable the entire set being changed in two

minutes if desired it is reported that this machine has bored many holes 30 in hes deep in hard ground in fifteen sec onds for each hale from the time the auger touches the ground, and it is hard ground indeed when the hole cannot be bored in a minute. It has force feed, and therefore all the attendant has to do is to pull the lever and the machine does the work

LAUSCH OF THE "FLORIDA."

On the morning of Thursday, May 12th, there will be launched at the Brooklyn Navy Yard the second of the two largest battleships yet built in the United States the 'Florida' The sister chip, the "Utah," which in December last took the water at Camden N I from the building slips of the New York Shiphuliding Company, weighed about eight theusand tons. The launching weight of the 'Florida' will be about nine thousand tons, which is, in itself a record for an event of this character. The keel of the "Fier ida' was inid on March 9th of last year, and the work of construction has been carried on uninterrupted; under the supervision of Naval Constructor William J Baxler with Naval Constructor William G Groe

beck immediately in charge fu view of the great importance of the ship, and the gratifying rapidity with which she has been built. preparations have been made to render the corof launching particularly brilliant. Among the guests or inducing particularly artilinant. Among the guestion on the inducing platferina will be President Taft, Secretary George Von 1. Meyer, Andstant Secretary Beekman Winthrop Albert W Glithrith Governor of Florida with bis staff, Admiral De wey, and Rear Admirals Nama Sperry 8 throught, Waltright, Potter and Lucize. As the battleship fieet is new present at the yard between six and seven thousand his jackels and the officers of the ships will assist in giving dignity to the event. In agreement with the cus tom of having our ships christened by a representative of the Siale or city after which they are named, the ceremony will be performed by Miss Elisabeth Flor-ing of Jacksonville Fia

The usual constructors and employes of the Brook lyn Navy Yard me to be congratulated on having, for 13n navy rare are to be congratuated on naving, for the second time demonstrated that they are capable of hullding the largest and most modern warships, not only with dispaic he but of the most thorough and durable workmanaidp, for it will be called to mind durable workmansling, for it will be cause to mini-that from these very ways here was launched on Sep-tember 29th 1804 the fagship "Connecticut," which, although a much smaller ship than the "Floridat" (less by about 6,000 tons, in fact) was unvertheless the

largest vessel of her time in the United States navy, and approximately as large as any vessel in the and approximately as large as any vessel in the navies of the world. It is a long step, however, from navies of the world. It is a long step, however, from a 5,000-lon "Connecticut" to a 12.83-lon "Britch, and the Brooklyn Navy Yard should receive full-circle for the fact, that while eighteen and a half monthy elapsed from the laying of the keel to the launching of the "Connecticut," It has taken all feurther months to do the same amount of work on the hig ship "The material has been built into the built at an average rate of about twenty-few come per working day of eight hours. If all goes well, the working day of eight hours. If all goes well, the The date of the machiner; he machiner; he machiner; he machiner; he machiner; he will be completed early next spring. The date of the completion of the machinery is som The date of the completion of the machinery is some-what uncertain, the recent reorganization of the nary yard having thrown the atenn engineering shops sumewhat out of their atride The greater length of the "Florida," which exceeds

The greater longth of the "Florida," which accords the "Connection" by over stay for teet, the greater learn of seven feet four and a half inches, and her the control of the seven feet four and a half inches, and her necessitated, of crures, a great enlargement and strongthening of the permanent and issueshing way, and severely tract the capacity of the building slip (fur front page illustration shows how the ram of the silp cutted caracteristy across one of the streets of the in spite of this fact, the stern of the vess

impact to the buikhead wall on the water front
Just here it is well to notice how, in order to se Just here it is well to notice now, in order to secure the desired speed of 29 75 knots, the lines of the ship have been fined out, as compared with former battle-ships. The entrance of the "Florida" appears to be as fine as that of our armored cruisers. At the samo, time in order to secure good lifting power forward, when the ahip is driving into head seas, above th water line the sections are flared out very rapidly, thus giving the ship a form which is not only husyant and seaworthy, but adds greatly to the appearance of

The "ways" consist of the permanent ways made un of the supporting piling, cross caps and longitudinal timbers and the lannthing ways, in which she im modiately rests, built to conform to the underwater form of the ship, which travel with her as sho moves down into the water The heavy longitudinal timbers, which form the sliding surfaces between the fixed and iannehing ways, are thoroughly lubricaled with a special preparation, consisting chiefly of talle lard oil and graphite. The contact auriaces are made sufficiently broad to bring down the maximum area sure on the ways to 23 tons on each square foot. The ship is released and started on her swift slide into the water by sawing through the "solo beame," which are the last members that connect the lannching ways with the permanent ways. The "Florida" will move very slowly at first but gather way rapidly, and her

very slowly at aret but gather way rapion, and ner highest velocity will be about twenty miles an hour With the launching of the "Florida," the United States navy will have affect the first complete division of chips of the dreadcought type consisting of the "Delaware," "North Dakota," "Utah," and "Florida." abowed, a necessary protection Between each pair of blinch guns is a l-inch transverse, splinter bulkbead. The "Fiorida" will be driven by an equipment of Parsons turbines, working on four shafts. They are required by contract to develop 38,000 horse-power, which, it is estimated, will anable the ship to maintain an average speed of 20 75 knots on trial As a matter of fact, she is likely to do from three-quarters to a knot better than this. The "Florida" will store, an addition to 2 500 tons of coal, some 400 tons of oil fuel. addition to \$600 tons of ceal, some 400 tons of oil fugl. Our navil constructors have long recognized tha value of oil as an auxiliary fuel, and as far back as \$400, when the plans of the "North Dakota" and "Dalaguage" were drawn, previator was made for atorage of all, the ships of that class carrying 400 tons. The keel of the "Utah," built by contract with a

private yard, was laid on March 15th, and the keel of private yard, was laid on March 16th, and the keet of the "Florida" on March 7th The "Utah" was launched on December 23rd, 1809, at the 50 per cent stage of completion, and the "Florida" on May 13th will take the water with 58 per cent of the work completed, a om-parison which establishes once more the much des-tested claim of the Brooklyn Navy Yard that it can build as rapidly as the private varde

The Enbricating Value of Mineral Lubricants at Wish

The behavior of a mineral inbricant at very high temperatures is dependent upon its chemical and physical properties upon the nature of the atmos ere with which it is in contact—dry air carbon dioxide, or water rappr—and upon the pressure of this atmosphere Schreiber in a recent article de-scribes his investigations of the jubicating value of mineral hibricants of very high meiting points, in various conditions The diminution of the inbricating power at high temperatures is due to the evaporation of a portion of he lubricant and to the formation, by of a portion of the unricant and to the formation, by oxidation, of compounds of the nature of asphalt, i.e., compounds insoluble in benzine it is not due to polymerization, as is generally believed. This increases in asphaltic matters is not produced in the presence of water vapor alone, even at a pressure as high as 7% atmospheres, in this case the dimination of the lubricating power is due solely to the craporation of part of the lubricant. On the other hand, when the inbricant is in contact with a gas which can exert an oxidizing action, compressed air, for example, the for-mation of these insoluble compounds is the chief cause of deterioration. Schroiber deduces from these experinents laboratory methods of measuring the lubricating power at high temperatures, according to the class of machine in which the lubricant is to be used

WHY WATCH SPRINGS BREAK. To the Editor of the SCIENTIFIC ANDRE

It was with an amateur's interest that I read the accession in your pages as to "Why watch springs reak." As the question apparently still remains unsettled. I feel tempted to contribute some additional views on the subject.

Formerly clock springs were finish giving the convolutions considerable frictional gric giving the convolutions considerable frictional grip upon each other For this reason, when running down, there was a very audible shuffling sound within the clock svery faw minutes, indicating the propelling force was spasmodic. Not only so, but the ticking sound of the escapement decreased in londness as the was prolonged from the last loosening of the To regulate this it occurred to me to apply a more unctuous lubricant to the spring to prevent the said friction. The result of so doing was a gratifying uniformity of tick-but only for a few hours-until

e spring broke
After the third experience of this kind I cea regard it as a mere coincidence, and thereafter applied so oil if there was sufficient to prevent rusting already on the steel

The nucciling of a watch spring and of the kind of clock spring that has just been described differs in that the watch spring unwinds from the outside of the coil, while the clock spring arbor backs up and un-winds from the center of the coil For this reason winds from the center of the coil For this reason the latter is not subjected to a breaking from contrac-tion due to coid, as there is always some room for the contraction to take place—excepting a possible mo-asymtary period just after winding. The same is not

sentary period just after winding. The same is not the case with a waich spring. If over-tubrication is destructure of stool in a clock spring, by readering all the convolu-tions continually active and under unremitting strate, the same would also apply to a watch spring Watch springs being smaller than those intended for clocks are naturally proportionally stronger and may conduc-te strain longer, but that it is detrimental in proba-ble. But oil on a watch spring is absolutely necessary solety to provide for this thermostatic movement which can only take place back and forth, to and from a can only take place back and forth, to and from a fard point—the arbor Yet the wearying strain on a spring due to over-tubrication can only be a centribu-tory cause to the prevalent breaking of this part. Extory cause to the prevalent breaking of this part. Ex-perience goes to show that the most frequent time for breakage is from an hour to three hours after wind-ing, and that the most frequent position of fracture in just outside of the annealed tip attached to the

Thus the owner takes his watch from his pocket where its temperature was, say 80 deg, and winds it until it brings up hard. The coll is then central and solld upon its arbor, which is held fast by a pawl

in a little while the wearer of the yest containing in a sittle while the wearer of the vect containing, the watch removes it, hanging it on the back of a chair while he retires for the night. The temperature of the watch pradualty falls to asy 60 deg. If as contraction been provided for? The morning will discuss. If the coil has not been wound too tightly on, if some time has elapsed before cooling to enable it. draw on what has been paid ont, or even if th rate of cooling and consequent contraction has not ded the rate of release due to the movement of the works, the spring may escape But what approplied the writer is not the breakages but the length of

ice many springs attain

When one considers that the greatest movement of contraction is on the ontside of the coil, because of its contraction is on the ontside of the coil, because of its greater area, that the coil has just been rendered tant and rigid by winding, and that then a powerful con-tracting force is added thereto, principally on the out-side of the circle where the leverage is greatest, it

since of the circum what an uncondurate strains is not difficult to resilies what an uncondurable strain takes place close to the fulcrum, the arbor, for the spring is then but a solid lever

The fracture of a spring in many places is also not hard to understand, if we imagine a spring stretched to its elastic limit by contraction from cold with no slack to draw upon, each turn of the spring, from the outside inward, at an ever-increasing tension. An the outside inward, at an ever-increasing tension. An inner turn enaps, instantly contracts, and by that pronner turn anapa, narazury contract, and ny tian trees forces increases the spreading or expanding trees of temper. The change is attagether too rapid to permit of any uncolling movement, and the force thus added to the adjapent surrounding strand fractures that, gathering force with each smooseding fracture until, like a "Prince Rupert's drop," the pont-up strain comes

the a "Prince Ruperts drop," the peni-sp strain comes to rest with explosive suddenness.

That the pieces display magnetism does not necessarily indicate that it was produced from external influence, but rather that it was evolved by excessive strain and retained by the steel by virtue of its hard-ness, as is similarly evidenced by many machinists

tools subjected to severe service.

Regarding the preference of springs to break in the

summer months, is it not sufficiently evident from the following three causes?

1 The more constant and wearving strain due to

the better inbricating effect of warm oil.

The increased solidity of the coil when would
up, due to a thiuner film of oil between the convolu

p, due to a thiuner film of oil between the convolu-lons, also due to warmth

3. The looser texture and greater proportional brinkage of a warm spring compared with a cool one.

As to the remedy for this uncertainty of time-keepwould seem sufficient to provide for the ion tudinal expansion and contraction of the springs, and the simplest way would be to make them of metal in the simplest way would be to make them of motal insensitive to these changes. Such an alloy has been described in Scientific Americans Southamer, which he calls "inver" and in composed of steel with an admixture of \$1 per continuous and a composed of steel with an admixture of \$1 per continuous and graduated eaches for instruments. The fact that it does not rest should complete its adaptability to this purposes, as then it could be used without labricant and thus, except for a short portion at one time, be relieved of continuous and active strain

relieved of continuous and active strain Just how the nickel component will affect its per-manency of temper remains to be proven, but even if it retains sufficient recoiling force for its purpose for five years only, it would at least give warning of its waning strength and not leave its owner in th

which is perhaps all the improvement needed Another possible remedy which modern practice would indicate as quite feasible would be to carbonize would indicate as quite reasine would be to exponues the rods or plates, from which the springs are drawn, from one side only. The result would be, when chilled, a hard side (for the inner side) and a soft or elsa-tically tough side (for the outer side) with a general benefit of greater suring power with improved tensile strength

Watchmakors will tell you that the breaking of main springs saves many good watches from having their pivots out off, from shear wear, and the views of the facturer need not be consuited but the ordin citizen would prefer to have the spring as reliable as the rest of the watch James E France. St. John N B

INTERESTING MAGIC BOUGARD.

To the Editor of the Scipturic America in the December 11th issue of the Scipturic America cav (page 436) Mr. A Gaipin gives an interesting construction of magic squares, containing all the old

ers in the inscribed diagonal square numbers in the inscribed diagonal square. But this construction is applicable not only, as for Galpin says, when the basis is a prime number, but more syner silly when the basis is an odd number (1, 3, 5, 7, 8, 11,). The proof is very easy there is here the square of 9, as a cample of the simplest odd number not prime the general proof is an interesting exercise of algebra. on, Italy

STOROGRE IN A HOT-WATER STREET

To the Editor of the Scientific American
A short time ago I noticed a phenomenon which I
believe will be of interest to many of the readers of

the Stipatific American

The main building of our experiment station here is heated with hot water—It has been one of my duties heated with hot water It has been one of my duties to see that the system is working properly, and in this connection I have had to open the air vents on the radiators frequently I was surprised to find that the radiators on the top floor (a two-story building) al-ways seemed to have air in them, in spite of the fact that the system was fully charged and very little or no new water admitted I began to suspect that this condition had to be accounted for in some other way condition had to be accounted for in some other way was there not a possibility that this gas could be hydrogen. For what other gas would be likely to form under those conditions, unless it be a trace of carbon monoxide? At any rate, when I applied a match the gas lighted with the familiar pop of hydrogen and burned with its characteristic almost colories fame. Assuming that the gas is hydrogen (I have no means of testing it) the question suggests itself—is this a case of exidation of the iron setting free hydrogen? In it an electrolytic effect, caused by galvanic couples of

sither carbon and iron or iron and the brass comago-tions in the system? Or is the gas methane? It may be noted further that the gas does not seem to collect in the radiators in the lower floor to a great extent if any Of course, this may be due to the gas higher dissolved under the increased static pressu-static pressure on the radiators of the top ficover ten feet of water at the present time The water of axceptional purity, being supplied by a spring The fact however that small quantities of water have to be added occasionally to replace the leaks in the estion can only be settled by chemical analysis

A New Sense Organ of Butterdies

Every butterfly collector has had the unpleasant ex-perience that some butterflies, and particularly those of the species of Catocala (mourning clock) will no-lice bis approach from a distance and fly away in time. This observation ted Tebus to think that these nimals must have an nuditory organ which warns them of approaching danger by recriving sounds, and arcordingly he expressed the supposition that two pit-like depressions at the first posterier segment of the ody might be organs of hearing A therough investibody might be organs of hearing. A therough investigation of this ergan, heaver, has been made but recently by Prof. Dr. Deegener, the results being published in Zoologische Jahrhücher, Ahtellung für Anstonilo, vol. 27, Ne. 4. 1969

it is rather surprising that with a group so fre-quently collected (although indeed investigated, as a rule only as to their position within a system) as the Noctuids, an organ cenid escape observation which is nd quite generally in this group and which is by no means inkroscopic, but can be observed without difficulty with the naked eye as a siriking farmation on each side of the first abdominal segment. This location probably expialts why this organ should have because in by many persons without arousing the sus-picion that it could be a sense organ, for naturally enough such organs are looked for chiefly at the head, particularly at the feelire, sithough ether parts of the body may be the seal of specific sume organs, for instance, grasshoppers have their organs of hear-ing at the base of the abdomen, that is at the same on where the corresponding organ of the Nortuids

When examining the animal we see on cach side at the line separating the chest from the abdor and near the points where the rear wings are attached, a deep channel which toward the surface is surrounded by several humps. The external morph fached, a deep channel which toward the autrace is aurrounded by several humps. The external morph ology of this organ varies in details with the different period of the organ varies of the control of the organization of the autrace is a scarce by visible from the outside being convexied by long hairs at close foughter. The mirroundy cannot be the organization of a series of sections shows this only one of the control of the organization of t sensitory hairs and thus gives the organ the character of a sense organ. Telens's supposition, mentioned above, that this is an auditory organ may very woll be maintained since the structure of the organ an above, that this is an auditory organ may very woll be maintained since the structure of the organ an awers all the requirements of an organ of hearing Billit experimental confirmation of this hypothesis with have to be awaited Dr Deegens promises a further report, dealing with this phase of the subject.—Pro-

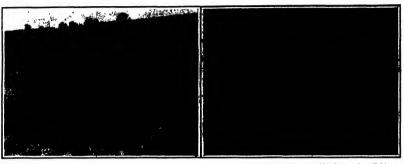

Approximately 3.748 miles of new main track were built in the United States during the year 1909 as compared with 3,214 miles for 1908. The 1908 record the smallest since 1897, when 2,109 miles were These figures do not include new second tided or fourth track sidings or electric lines. The net is crease during the year is about 1614 per cent, and 28 per cent less mileage was huilt than in 1907

REINFORCED CONCRETE WATER WORKS CONSTRUCTION

BY FRANK C. PERKINS

The accompanying views of the indianapolis water works show an interesting application of reinforced concrete to this class of construction. A gravity flow supplies the reinforced concrete filter plant from the Indiana State Central Canal which was constructed originally by the State for transportation purposes, but was taken over for water works service. At a disA reinforced concrete pipe line which is 840 feet in length, and has a diameter of 64 inches, and a shall 6 inches thick, conducts the raw water to the precipi tation busin. The pipe is laid 11 feet below the hy-featile gradient. It is reinforced with 4-inch twisted bars apaced 8 inches on centers, the shall of the pipe being built in three operations.

are 8 inches in width and 18 inches deep. They are carried on 18-inch 1-beams, inceased in concerts and bolled to the outpurs. The reinforced partition walls, 1 foot thick, are 350 feet in length. They are rein-forced in both directions, and measure 14 to 17 feet in height. The entire siah covers 70,000 square feet in each double filter 1 it is built monolithic, without

View showing construction of the ground-arch floor, with the reinforcement

tance of about it miles above the intake to the filt is are licated the head gates and concrete sluice ways of this causi which is carried over Falls Creek near the filter plant in an open squeduct at an elevation of about 18 feet above the creek

The chemical house columns, floors and walls as well as stairways and roof are of reinforced concrete throughout. The lower part of the building contains the ilms saturating tanks over which are constructed the iron solution tanks all of which are of concrete Thoy are used in connection with the coagulating ns in the treatment of the raw water during

seasons of excessive turbidity

The following account of these works is based neon
data furnished by the constructing engineer, William
Curtis Mabes The water, which is drawn from the
Raw River is clarified by congulation in precipitation Raw River is ciarlful by congulation in preclytiation basits, which are provided with battle walls spaced 70 feet apart, and which are reinforced for the prevention of crarks. A line shall of coprete, reinforced with visited roots spaced 4 feet apart in each direction is used for lining the sloping embaniments of carts white the shall foor, taid in block as Net square, is 4

The water is measured in a Venturi meter, 42 Inches in diameter which has a throat diameter of 21 luches. The meter is built in the raw water couldn't the indi esting apparatus being located in the laboratory

In the construction of the conduit a coucrete cra in the construction of the conduit a concrete eracle io inches wide was first laid to grade in this were imbedded the lower rods, which were heated and bent in the field to the required shape, and left long conough to project a foot into the upper ring. On the cradle were then placed the semi-vircular metal forms, which ere fastened down by staked timbers. The mixture ut, in the proportion of 4 of gravel, 2 of sand, and 1 of coment, was poured into the space forming the lower half of the pipe. The upper half was then constructed by inverting the metal forms. The cost

constructed by inverting the metal forms. The cost of the pipe, which contained about 300 cmble pards of concrete, was \$11.46 per cmble pard of concrete, was \$11.46 per cmble pard of the pure water reservoir, with a capacity of \$1/20 million galloins, was built near Fails Creek, on a gravel toundation, at ordinary ground water level. The earth filling in 2 feet deep on the cover, the weight of the structure lizeff or relatancing any upward pressure that may occur The groined arch bottom was delared to resid the upward threat of a generous hearth of the control of the co sized to resist the upward thrust of high ground water at such times as the reservoir is empty, the inverted groined arch construction distributing the iold uniformly over the bottom. The reinforcement of the bottom roundsts of 15 inch twisted bars, spaced to luckes on century in each direction. The filter cover roundsts of reinforced 3 inch sides, supported by concrete beauss, a tritle lies than 30 feet

supported by concrete beams, a trifle less than 20 feet long, and spaced nearly 7 feet on centers. The beams

any attempt to provide expansion joints. A cable traus-way with a span of 450 feet was used in the construc-tion. A stationary engine and cable was used for protion A maxionary engine and only was used for pro-polling a shuttle car on a narrow-gape track, over which the concrete was handled from the mixer to the cablaway, 80 cubic yards per day being used in cover-ing 5,000 square feet of surface. The cost of the filter covers was \$14.65 per cubic yard, and the cost of the walls \$12.06

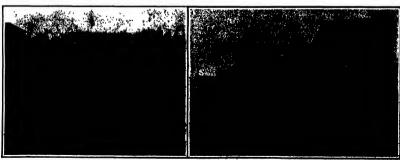

walls \$12.06

The reinforced concrete aqueduct, 300 feet in length, contains 4,500 cubic yards of concrete, which cost \$85 aper cubic yard instuding the comment, steel, sand and gravel, as well as the lumbor, forms, labor, and concrete labor. It is 41 feet wide and hase four spans of 60 feet each with a 10-foot riso from the synthight gills and a crown thickness of 18 inches for each of the four segm ental arches

each of the four segmental arches.

The foundations for the plors, wing walls and abutments were carried down 18 feet below low water, and
rest upon a bed of sand and graval. The aqueduct
takes the place of a wood aqueduct, which was supported by steel trusses on masonry plers, all of which were carried away by a flood which undermined the middle plor, the superstructure breaking up as the substructure crumbled away

With regard to the use of concrete for works of this character, Mr Mabos, the constructing engineer of these water works, makes the following comments:

Birel reinforcement of the 66-inch on

The emissi execute plant for pulping the execute.

Scientific American

Change has many advantages ever other types of solidericities. It is quelty and conveniently handled and trimsported, other set a best cost than stone meenry, and other subtable stand and gravel for the work in hand can be found on the site. With proper supervision, skilled labor is not essential in the small work, moreover, the art of mixing and handling concrete has been so perfected that machines do most of the work. Concrete has the additional advantage of the standard control of the work. tage over stone that it may be moided into intri-

cate shapes.

To produce onerest surfaces of a satisfactory smoothness and uniformity, it is necessary that the moids be carefully and properly built, and also that the concrete be of the proper consistency to flow adily into the prepared moids. It is also neces-sary to thoroughly churn and keep it in motion in the moids until the air has been removed and every the molds until the air has been removed and every crevice filled with mortar Properly handled in this manner, it will not be neccounty to brush or plaster the work after the removal of the forms. Con-crete may be placed in moderately freezing weathmountarity revening weather, provided proper precat-tions are taken to warm the gravel or stone and shad, to heat the water and to cover the work until initial set takes

Shane. The problem of preventing unity cracks forming in concrete is one that has worried many engineers.

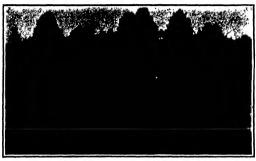

Plain concrete is liable to crack where you least on procition of these cracks by building abort sections in alternate blocks. However, by the juddelous introduction steal bars, objectionable contraction cracks can be equirity reiminated. entirely silminated

entirely eliminates.

The water works ongineer or superintendent is par-ticularly interested in the subject of waterproofing concrete it has been shown that wet concrete in more dense and consequently more impervious than more dense and consequently more impervious than dry concrets and that concrete becomes more or less portus as the quantity of cement is increased or ill minished A smoothly troweds surface produces a water-light sim or skin. It has also been found that staked lime added to its concrete mixture helps to make it less permeable. The lime does not injure the coment in any way, although relarding the setting Coal tar, pitch and asphalt mixtures applied on concrete are used with more or less success. A wash composed of one pound of itys, few peends of alumn and two gallons of water, applied with a brush and well rubbed in, has been used successfully on government fortifications.

ment fortifications.

A rich cement mortar plastered over concrete makes
a very good waterproofing medium. Proper situation
to these details will produce a water-tight structure,
if there is not likely to be contraction cracks, but in
works of any magnitude these are bound to occur
and they can be best provided against by the intrduction of steel bars. A rich concrete properly rein

wing the ground floor, the reinferced slab roof, and the Covered reservoir under construction, al

forced, conted with plaster and troweled smooth makes an ideal waterproof structure

The Baylight Edictory of Artificial Illuminants. In a recent publication of the Bureau of Standards, Mr H B. I've suggests that there is need of some method of cetimating the resemblance of artificial illusionants to daylight, that is, of elevermining their daylight efficiency. Assuming that, by the extraction certain qualities of light in an illuminant its color could be brought to resemble that of daylight very closely, the daylight efficiency of a source might be expressed in the form (intensity of available white injustification of the composition of the compositio In a recent publication of the Bureau of Standards, which, as explained above, could be used to bring the color of an illuminant into near agreement with day-light, though reducing its intensity in doing so Mr Ives presents some spectrophotometric curves of vari one sources of light, and a diagram tilustrating the amount and nature of light from the various sources amount and nature of light from the various sources which must be absorbed to produce white light He also tabulates the "daylight effectors," of a number of artificial illuminants. The method, however, is of of artificial illuminants. The method, however, is of practical rather than of scientific interest since it depends upon the particular wave-length for which the intensity is assumed to be unity, whon plotting the spectrum curves. In addition, "selective" sources such as the mercury are lamp ctive" sources such

which yields a spectrum consisting of isolated bright itnes, would work out to zero effickney ac cording to the above method Yet if we judge hy sensation such sources contain a certain amount of white light Mr Ives then proceeds to discuss the fact that any color can of white light and one ray of white light and one ray of the spectrum. The ratio of the white light used in attaining such a match to the in naity of the source studied is then the source studied is then regarded as an alternative method of defining white light efficiency which Mr Ives in this case ierms "white sensation efficiency". He points out that classification on this metid gives rise to materially different results from those strived at by the former method. The ef

ficiency in the case of the second method appears to be higher Yet the result gives no indication of the higher Yet the result gives no indication of the ability of the source to reveal colors of surrounding objects, and merely indicates the color of a white an face illuminated by the source in conclusion, Mr Ives remarks that the first method is preferable from the practical standpoint, and the latter from the purely

It is estimated that the Gold Coast and Ashanti could supply 60 843 logs of malogany and cedar per year if the internal communication were better With mechanical basinge, such as traction engines and light tramways, the output could be increased to some 250 000 logs per annum without depleting the natural

to solders that so much of interest to the amateur astronomer happens in a single month as in the one which is

nat before us

First and foremost, of course, is the return of lialley's comet to the post tion where it is seen to the best advanting Early in the month it is favor ably placed for observation before day break, on the 18th it passes directly

between us and the sun, and later it appears to evgreater advantage in the evening sky

At the beginning of May the comet is about 74 millton rolles away, but it approaches us rapidly, its disdiminishing to 41 million miles on the 10th, 27 million on the 14th As It was about at the limit of visibility to the naked eye on April 12th, while still 135 million miles from us, it is now a fairly conspicu

The planet Venus is fortunately near by and serves

as an excellent "pointer" as the comet. Anyone, however little familiar with the heavens, can easily find the latter by observing the following di

rections. Choose a window from Choose a window from which the eastern sky is lisible clear down to the horizon Rise about 3:15 A M and look due east. The very bright starlike object, low down in the aky, is Venus The comet is to the left of this and a little higher up at a distance about as great as the length of the bowl of the Great Dipper It will probably be rather fainter than the four slars, forming a great square, which lle above and lo the left of Venus, about twice as far away as the comet. These directions hold

These directions hold good from May 1st to May 12th On the 14th the comet will be on a levol with Vanus, and a little farther to the loft On the 16th it will be much lower than the planet and about 20 deg to the left. After this lie comet, or at st its head, can hardly be seen clear of the morn-

It will be very interesting to watch the comes grow larger and brighter night by night as il comes nearer to us How long its tail will be it is impos-sible to predict. The best time to see this bowever, will in any case be from the 7th onward, when the

the fth onward, when the moon is not of the way and the sky dark. The camest will be larger and brighter, too, at this time than previously. Even after the bead gets too near the ann to be seen, the tall may be observable in the mornings of the 17th and 18th extending upward and to the right. From the custy-the-rhoring, perhaps broad and shaded, from the effects of perspective since the end of the will be more house or the total the state of t of it will be much nearer us than the head

of it will be much nearer us than the head On the seeming of the 18th or morning of the 19th (according to the observer's longitude) his comet passes between us and the sun, and the earth will be caveloped in its tail if the latter is long enough

(over 15 million miles)

If this evening is clear it will be of great inter If this evening is clear it will be of great interest and importance to look for illumination of the sky in the early evening, just after sumset, the consist at will be in the cast, but a few home later it will have passed over toward the west. If, as is successful to the sum of the sky in general is comparatively brightly illuminated separated by an interval while we are in the deflace center of the skill because of the state of the sky in general to the sky in the sk tall Meanwhile, observers on the opposite side of our planet will have the rare privilege of seeing the sun through the comet's head. Only the extreme western portion of the United States is included in this favored region, but as the comet suters upon the sun's disk at 6 22 P M by Pacific standard time and remains on it till 7.22, the transit will be visible all along the coast. The comet passes almost squarely across the center of the sun from west to east.

action the center of the sun from west to east. Paradorical as it may seen. It is probable that the ordinary observer, even with a small telescope and dark glasses, will not be able to detect even the alighiest trace of the comet's passage. With powerful instruments the nucleus, if sold, might be seen as a dark spot a against the sun, if it is over 10 miles in diameter, but it is improbable that it is anything like so large, for, as has already been sated in these counts, when remote from the sun, is no more than a single mass of 0 miles across would send us. a single mass of 0 miles across would send us. Company to the contract of the section of the spectroscope, and as we will be looking through the tail lengthwise,

the sun on the 2th and of the moon on the 23rd. The former is an important collipse, the maximum duration of the total phase being over four minutes, but untertwastesty the trent of the shadow lies almost entirely in the Southern Ocean, only crossing the ootthern half of Tamessin, so that few sations are available for observers. As a partial cellipse its visita throughout dustrials, New Guines, and the solidboring islands

ble throughout American, ever
being lainade.

bra. This ectipse will be of importance to observers on the Pacific coast, as it will give them a chance to photograph Halley's comet on a dark sky The comet will have set for us in the cast before todility

THE HEAVENS With so much else to an gage our attention, our glance at the stars must nent constellations in the est are Gemini and Cante Minor, in the northwest, Auriga, due north, Cassiopela below the Pole, Ursa Minor and Draco above, and the Great Bear almost and the Great Bear almost overhead. In the north-east Lyra is prominent, and in the east Hercules, Corona, and Bollies. Scor-pio is rising in the southeast Due south is Virgo As our initial above, there is not the alightest resem blance in the stars to the figure for which they were

We may note the bright star Spica, a spectrosco-ple binary at a great dis-tance from us, and the double star γ (now close to Jupiter) which is now separable with a small telescope, but in 1835, could hardly be seen double with the largest instruments then existing The two components were then at the closest point of the very eccentric orbit, in which they revolve about one another in some 180

At \$14 e'clock Auril 88. RIGHT SKY: APRIL AND MAY

nearly 15 million miles of it will be there to exert effect on the sun's light. Even so, it will not be surprising to many astronomers if nothing un-

Buch negative results will however be scientifically valuable, since they will enable us to say that the materials composing the comet do not exceed certain limits of mass or density

certain iming or mass or density

Transits of comets across the run are very rara.
The most remarkable previous instance is that of the
great comet of 1882, which, though so bright-that it
could be seen close to the aun in broad daylight with
the naked sye, vanished completely when in frest of
the sun's disk, showing that it was practically per-

On the evening of the 19th we may perhaps aire On the evening of the 19th we may perhaps airseady see the conset: sail in the swening sky, though its head will set while the twillight is still very strong. On the 30th, however, it will be wished it! about 9 P M. on the 19th however, it will be wished afterward wall ster 11 P M.

On the 31st the councils bead will be close to the silar y deminerary in the 32rd about 10 deg above procyon, and on the 38th near and C Hydrac Puller Procyon, and on the 38th near and C Hydrac Puller

stalls will be given later

This month is also notable for two total colliness of

years. THE PLANTS

Mercury is evening airs until the 25th, when he passes through inferior conjunction, between us and the sun, and becomes a merning star. He can be best seen at the beginning of the menth, when he sets more than 1½, hours later than the sun. At this time he is in Thurus between Adeburan and the Priedmes, and

in Taurus between Aldebaran and the Piciades, and should be easy to see.

Venue is merting star, risting a little after 3 A M and exceedingly completeous all through the much Mars is eventing star in Genini, setting above-1-1-10. H. in the endided of the mention, at which time he is quite close to the star of Geninion, but is visible more than the star of the sight, remaining in sight till nearly 4 A M, on the tat, and till a little before 2 A M, on the Sixt. Settors is morning star in Aries, risting abput an hore earlier than the san in the middle of the month and two hours at its end; but it is too lave to he conspicuous.

Uranus is in Sagittarina, and somes to the meridian at 4 A.M on the 19th. Noptune is in Samint, on servable most of the night. On the 19th he in conjunction with Mars, being 1 deg. 58 min. south of the latter. This may be a good chance for anasteurs with (Concluded on page 262.)

NATURE AS AN INVENTOR

BY PERCY COLLINS

Civilised man justly prides himself upon his numerous inventions and mechanical devices, but it is possible that inventors in general would beast less of their achievements did they resites that the patents in which they have established their rights are really which they have established their rights are really nothing more than modern reproductions of devices which have been comployed by Nature from the begin-ning of time I is a fact that there is scarcely an investion of man that has not its prototype in Nature Sometimes these prototypes are of a rengshand ready character More often, however, they have been brought to the highest pitch of porfection. It is little brought to the sighest pitch of porfection it is little brought to the highest pitch of perfection It is little short of amaning that primitive man should have re-mained blind, through so many centuries, to the sig-nificance and value of these inspections of Nature. It has been said that aimort and of man's achievements as an inventor have their prototypes either in the ani man as in inventor have their prototypes either in the ani man of the prototype of the about strictless and the prototype of the prototype of the about strictless short article—anything approaching a complete cata logue of these coincidences. Yet a few of them may be

selected, almost at random, and they will serve to show how, after much labor and thought, man has perfected devices which at the time appeared to him to be original, although in reality they were nothing

As a first instance we may take grasping tools—a whole tribe of implements ranging from surgical for-ceps and sugar tongs to gasfitters' pilers and the vast pincors by means of which great masses of white-hot metal are manipulated upon the giant anvils of our workshops It is a arcely too much to affirm that, workshops it is searchy too much to surm that, without such tools as these, art, science and manufacture would long ago have creased to advance. The reader needs only pusies for a moment to resilize how important a part is played by these familiar imprements in the activities of human life, and when man kind first discovered how to make and use such things he must have benefited instantly Yet all these tools he must have benefice instantly ret all tacse tools have their parallels in Nature, and one is fain to imagine that some of these prototypes might still sup-ply useful hints to modern toolmakers. Perhaps the most perfect example of the powerful pincer in Nature is the claw of a crab or a lobsit. The power of the crab's claw is so great that a bite from a large crab will inflict a severe injury. It is related that fisher men who have been feeling for crabs in the recesses men who have been feeling for trabs in the rections of the rocks at low water have or calculately had ilver hand selsed by a large specimen, and being unable to liberate themselves have been drowned by the returning tide. Among other pincer-carrying animals are scorpions, while the inserts known as carried active curry a dainly pair of forceps at the rad of the body. curry a uniny pair or foreps in the end of the board and employ the look for folding their simple and dell cate wings. The opposable thumb and for finger con-stitute, in effect a most useful pair of pile as adaptable to many uses and it is strange that anns should so long have overlooked the lesson in mechanics which Shears and selssors are of course closely they teach spears and sensors are or come closely ailed in principle to grasping tools yet they have come to us only with the advance of civilization—no savage tribes having the least idea of them or their ("ontinued on page 284)

DESTRUCTION OF A PERSON

It is Easy to make advertising

claims for cars; but to make cars that will make good the claims is hard.

We ask automobile buyers to do this: After the advertisements have attracted your attention, then in fairness to yourselves and all the manufacturers, compare the cars point by point. That is all we ask.

There are Chalmers dealers in all parts of the United States—more than 200 of them. We suggest that you get in touch with the one nearest to you at once. Let us send you his name if you do not know him.

Chalmers "30" \$1500

Judged by price alone you might as well buy some other car as a Chalmers: \$1500 is simply \$1500—no more in one bank than in another, no more in bills than in coin, no more in your pocket than in another man's.

It is only when you begin trying to buy something with your money that the sense of value enters your mind.

Your \$1500 is worth more than another man's \$1500, if at all, only because you are able to buy more with yours than he can buy with his.

We believe that when you buy a Chalmers "30" your \$1500 becomes worth more than \$1500 invested in any other car. Careful investigation will convince you of this fact.

Please remember you are not buying a price or an advertisement: you are buying a car. Therefore examine the car on its merits.

If you investigate thoroughly a Chalmers will be your first choice, if you are able to get a delivery in your territory.

It is difficult to get more in a car, at any price, than you can get in a Chalmers "Forty" at \$2750. The "Forty" has all the power one can want, the quality to endure, beauty of line and luxurious finish. Seats for seven if desired. Catalogue "R" on request.

atmosphere and the creation of a more or less perfect vanum. Ilke the old fashtned cupuling glass the well known toy known as the 'sucker,' reminds us of the octopus. By means of the sucker—a small circle of molat leather with a string attached—large stones may be ifted in exactly the saure mauner that the octopus dislodges rocks or holds down its struggling prey That compara-tively modern invention the pneumatic peg is an almost identical device peg is an almost identical device. The apex of the reg is fitted with a sort of a cup made of India rubber. When this is pressed upon a smooth flat gurface, such as a pane of glass the air is forced. out of the cup and a vacuum form The pressure of the atmosphere then causes the cup to adders to the glass with sufficient force to enable objects to be suspended from the neg Purifier the man who had studied the octopus

might have added to the inventions al-ready onunerated, that of the common

atmosphere and the creation of a more

ready onnurested, that of the common pumit, while raises water simply by the action of the atmosphere and the action of the atmosphere and action of the atmosphere and action of the ac ous firsthility of the snake is rendered possible only because the vertebras of this reptile constitute a long chain of balls and sockets beautifully adjusted one to the other Another very perfect exam-pic of ball-and-socket movement is found in the case of the seaurehin. Each of the spines with which the shell of this creature is covered is swollen at the base into a cup-like form and this cup fits accurately upon a little rounded promi nence of the shell, which exactly fits into the cup just as the ball of the human thigh bone fits into the acciabulum. The iegs of insects in their srituation to the budy supply examples of the ball-and socket principle too numerous to men

The idea of the flask or boilie is emi-nently natural—1 c it has played a part in the economy of Nature from time im emorial Perhaps the examples are to be found in the vegciable kingdom among the pisnis known as gourds, the seed vessels of which assume forms calculated to remind the least

We have already seen that the theory of life common jump might have formu lated taself in the mind of man arref ne-had studied the habits and structure of the oclopus. There is narrower a pro-totype in Nature for that far more com-pilicated device known as the force-joump This projective is the human heart Anatomists agree that it is constructed on principles which are marrelously up to-date. In an incredibly short period the whole of the blood in the human hody passes to the heart and is driven from it again with a force which carries the stream to the tips of the flugers and the stram to the tips of the flugers and thes, while as everyone knows the action of the heart persists, night and day, throughout the whole life of a man. If we regard the heart as the pretotys of force-jump wrought in metal by the hands of mankind we must still be to prove the property of the proper

its renovation and repairs are affected while the mechanism is in rapid motion.

The simplest form of sewing is that The simplest form of sewing is that which is in vogue among such primitive races as the Eskimos and Kaffra It con sists in boring holes through the material which is to be joined together and push ing the thread through them will observe that the operation is of so rough-and ready a character that no nee-die is required, and one is almost temptagine that mankind might a

25

the probed like prospects thus formed, it is methed of working resembles exactly that which has been detailed above First the sharp-political back is used to form a silt or hole in the leaf, and through this a piece of tough grass, or other vegetable fiber, is passed A second hole is made and the natural "threed" is drawn through it, and so on antit the work is completed by a tucking in and adjustment of unruly ends. Bhould the reader completed by a tucking in and adjustment of unruly ends a Bhould the reader in the property of the property discover that the latter are far less clumy than the former In a word it may be asserted with out feer of contradiction that mankind out feer of contradiction that mankind was not first in the field where the art of needlework is concerned. The even sum is another of Nature's own contriv

s so arts of spinning and weaving have also their prototypes in Nature The majority of nest-building birds exhibit a more or less strongly marked weaving ped in the case of a genus of like blods indigenous to the warmer part ilke hirds indigenous to the warmer parts of Asia and Africa The spinning of fine threads so as to form thickor strands and the combination of these into webs, are operations characteristi many insects and their allies. Many spi ders, as everyone knows, construct silker webs which they employ as a means of webs which they employ as a means of capturing their prey, or of protecting their egg-clusters from injury. But it is among insects of the sub-order Heterocera (i e the moths) that the spinning of silk ins been brought to the highest state of tice be turned the first aginans—the inventor under the pridish hand of Nature of this invaluable art. Take, for example, the cocess of the well-known Cercpla molt—the so-called American silkworm it is entirely constructed of silk, which is secreted by glands in the mouth of the grun or caterpillar. As soon as the insect has become full-fiel, and is about to putch the completed of the completed the process of the contract of the consideration is no intrincis that consideration is no intrincis that consideration is not intrincis that consideration is not consideration. lice be termed the first spinnersstruction is so intricate that considers struction is so intricate that considera-tions of space forbid us to describe it in detail. Suffice it to say that the cater-pillar first constructs of sliken threads a kind of scaffolding, or framework, and then—laboring from within—goes to and fro about the skeleton structure depositfro about the skereion and by means of ing its endiess silken thread by means of ing its endices eliken thread by means or a figure of eight movement of its head in this way a kind of tent of marrelous toughness is built up, wherein the caterillar changes to a chrysalis and passes andry through the quiescent period of its existence, to emerge eventually as an adult moth

In passing, the reader may be reminded that many kinds of caterpliairs contrive a kind of trap at the month of their cons similar in principle to those made by man for the capture of crabs, lobaters, and relia Wiltin the neck of the Binstein control arrangement of stont, briefly appendages which form a well-sigh imposetrable barrier against the attacks of commice which may attempt to force an estrance from without Yet owing to the estimate of the stone of

The writer is not sware whether Nature's contrivance of a box that cannot reli off a shelf has ever been put to practical use by mankind II is obvious, however, that such a device might very well form the besis of more than one valuable inwestion. The principle may be studied by all those who are shie to be studied by all those who are shie to as breeding places—or, indeed, by these (Constituced on space 300).

Don't Play with Fire

A COMMON caution to children but also good for grown men and women. You are playing with fire when you insure your property without carefully selecting the company which promises to protect you against loss. Companies differ just like individuals. Why take chances when, at no extra cost, safety can be had by simply saying to your agent when your insurance expires, "Get me a policy in the Hartford."

The Hartford Fire Insurance Company is the best known of all the fire insurance companies in America. For a century it has promptly paid every loss, the aggregate now amounting to more than \$130,000,000. Its reputation for fairness is unexcelled. Its resources are never in danger from the hidden rocks of stock speculation, because invested only in the safest securities. One hut ared years of life and growth have demonstrated its able management and unshaken stability. You are not playing with fire when you

(Continued from page 185) of these birds on an ordinary shelf or table I for sexts a fost a sex criting on a table, the odds are in favor of its fulling to the ground. Not so however, with the eggs of i-dee frequenting are birds. For the forms of the states, that it is streadly impossible to impart to them may but a civilar movement. If disturbed these eggs roll round and found until the imparts after to them is expected. It is a stressly measured datas upon the imperious color of the of these birds on an ordinary shelf or dilate upon the importance of this de-tire insamuch as such eggs, being fald on the narrow ledges of perpendicular rosks would—but for their peculiar form—be precipitated into the sea upon form—be precipitated into the few upon the slightest movement of the parent bird. As it is careful observers have stated that although there is a constant coming and holing smong the birds and a constant rotation on the part of the

ggs not one of the latter is dislodged The stings and mouth parts of insects typify in many ways the devices and inventions of man. The aling of a bee or a wasp might well have been taken as a model of the modern hypodirmic syrings, so too, mighl like claborate ar rangement of blades and saws by means of which the female mosquito makes of whith the female mosquitto makes and enlarges her puncture. The instruments, fitted together and working in misson, form as tube through which the insect aucks the blood from her victim and intelestally incustors have also included in the second in th panying pholograph. The fact that the sharp blades, tools and saws its sittin a sheath when not actually in use is of capecial interest, for herein we see typi ded the sheath or scabbard by means of which mankind protects the keepness of his edged tools and weapons his edged tools and weapons. A sim-more perfect type of the hypodermic syringe is the fang of a polsonous sunks. When the reptile makes its stroke, the base of the fang is driven against a reser voir with the result that the liquid poison is driven through the tubular fang and forced into the wound. Even in the case of large snakes, these deadily exagons on the surprisingly slender and delicate, on that the wonds made by them would be quite inconsiderable were it not for line fat that and endely liquid is injected—exactly as in the case with the bypoder control of the case with the bypoder. voir with the result that the liquid poiser

reactly as is the case with the bypoder mice syrings. There are many natural devices by mans of which plants and animals travel through the air and mankind is at revenient engaged in a close study of these with a view to perfecting his own strings and from the string and habits reachibe halloons most closely are the scaled gibbs fisher of tropolar sace For the most part their bodies are covered with strong splunes, or at least with hard plates, but the strangest theretexists, but the strangest theretexists. of these ocean dwellers is their power of dilating the gullet with air, when the dilating the guilet with air, when the body swells out into a globe-like forms and the spines are creeted, furnishing a formidable protection. When so inflated, gibbe fish are unable to swim. They drift about upon the surface with the underside turned upward, and skim over the waves impelled by the passing terms. over me waves impered by the passing breeze. It cannot be doubted that this singular habit reminiscent of the bal-form is beneficial to these fish in that it enables them to escape the onslaught of sharks and ailled carnivorous creatures of the deep

in conclusion, we may glance for a mount at Valure's own electric batter les—lao remarkable examples of the capacity of animal structure to produce electricity to store it so to speak, and to electricity to store it so to speak, and to discharge it at will Both those erea tures are flab one belonging to the sel iribe, the olber bring a species of my known as the torpedo flab. As a matter of fact the lorpedo rays belong to several species which are met with in the Allan (Oencluded on page 287)

tie. Mediterranean and Indian Oceans.
The broad, smooth body has a rounded outline, and on each side of the head outline, and on each side of the head there is an electric organ capable of giv-ing electric shocks. The accompanying illustration shows one of these fish dissected to show the seat of its electric power On the left, the nerves supplying the organ are dissected away The prismatic areas on the surface of the organ indicate the vertical columns of electrical plates, of which there may be 500,000 in each organ. The arrangement of these piates, or disks, is like the metallic por pincon, or class, is like the metallic por-tions of the voltaic pile while each is separated from its neighbor by a delicate membrane, which takes the place of the cloth. The object of this electric power on the part of the torpedo ray appears to be to enable the creature to secure its prey either by killing it, or rendering it temporarily insensible. It is said that just before the shock is delivered, the ever are depressed in the head like those of a toad when swallowing a large in

The electric sel of Southern America stimes attains a length of six feet, and its electric organs are proportionate and its electric organs are proportionate-by four times as large as those of the improdo When about to deliver its shock it points its body in the direction of the intended victim, stiffens itself and with intended victim, stiffens itself and with a sort of shudder, the electric fluid is smitted. It is said that the flat which is the object of the discharge rarely or never escapes but simultaneously with the shudder of the sel turns on its back and lice motionless—an easy prey to the electric monster

It would be possible to dilute at much

It would be possible to dilate at mush greater length upon the natural prototypes of human inventions. Enough has been panned, however, to show how frequently man's thoughts reflect the device which arready saist in organic as vive which arready saist in organic as far to seek if so many existing his man inventional have been anticipated by Nature, we may conclude that with Nature list the secreta of inventions yet to come, nor can it be doubted that a close stday of antianal and plant life will from time to time bear fruit in the form of mechanical devices which will prove of pestimable value to mankind at inestimanto value to manging at large For this reason, if for no other, the in rulcation of Nature study in the minds of young people is highly desirable

THE WICE AVIATION WEST.

(Concluded from page 372)
ade but one stop, at Litchfield started readily from that place at 4.09 A and covered the remaining 68 miles in 1 hour and 21 minutes beating the train nour and 21 minutes beating the train that accompanied him. The last 24 miles were flown in 24 minutes on account of a favorable wind. Eight thousand people are reported to have watched him arrive and to have given him a rousing we

Next to the Bieriot Latham race across the English Channel last July, this cross country flight is the greatest achievement so far in aviation In the light of what has already been accomplished it would seem that from 800- to 1,000-mile flights vithout a stop for fuel are now quite sible of accomplishment the only limit ing factor being human endurance . It both his attempts at flying from London both his attempts at flying from London to Manchestr Graham White was obliged to give up on account of the great strain undergone by him in matraining the equilibrium of his biplane in the strong and gusty wind When some device in provided which will maintain equilibrium automatically, the strain upon the aviator will be greatly relieved and driving an aeroplane will then be no more fatiguing than running an auto-

NEW QUEBEC BRIDGE DESIGN

ACCOMINATION to a reset them to one of the Very Varia duline the quibe Fridge Board Very Varia duline the quibe Fridge Board on the property of the property o it is stated furthermore that the Domini government will require not only that the contracting firm accept full responsibility for the project whether it beconstructed on the Board's design or from its own plans but also that the firm make a very large cash deposit as guarantee of successful completion of the

The design now approved by the Commission says the dispatch is that which was sharply criticised a faw months ago in an American scientific periodical", and we are informed in this connection that the Cana dian government has decided that the criticism unde did not justly apply We are further told that "the Hoard while convinced that the designs will make a safe and untisfectory bridge is not disposed to closto other designs

Since the Services Avenuas is the only journal that has printed the plan of the new design drawn in by the Board and subjected it to extended criticism we presume that we are the American scientific periodical referred to. The plan and discussion was printed in our issue of February 12th, and our readers with remember that we look exception to the design on the ground that it was not only of inferior merit consid ered from the bridge engineers stand point, but that if constructed it would be the 'ugilest bridge of monu If constructed it would be the 'ugitest bridge of moun-mental recognitions among those hilberts proposed or built. Only clean was also made to the decision of the control of the control of the control of the such that a similar it rigidally in the Porth bridge, which is of loss again, having a ratio of width to length of 1 of 1 whereas the qubest bridge would have a ratio of outy 1 to 20. We objected further more, to the height of the thorse, which is the Barrets control of the property of the control of the property of the control of the control of the control of control of the property of the control of the control of control of the pre-tile the property of the control of the control of the pre-tile of the control end of 130 feel in the Forth bridge. We showed atso that the effect of low helght and narrow width had been to unduly increase the weight of the atructure the Queber bridge requiring the enormous average weight of 24 ions of steel (half of it nickel steel) per illnear foot as against a weight of only 10 tons of arbon steel per linear foot in the Forth bridge—an increase out or all proportion to the heavier loading of the proposed Quebec structure. The value of the Board's decision to lattle outside designs depends upon the ingith of time that is

allowed to bidders for the proper preparation of plans for a structure of this great importance. The Board has taken about two years to prepare its own plan, and if outside bidders are to be limited to a few and if outside bidders are to be limited to a few mosphs time it is scarrely likely in view of the heavy penalties imposed that they would be prepared to put to bids which they must perforce have thrown to-gether very hastly if the competition is to be thrown open to the deaksurm and bridge builders of the United States and Europe not only should abundance of time be given for the working up of the necessary plans and estimates, but il would be advisable for the plans and estimates, but it would be advisable for the Canadian government to arrange for the plans, both of the Quebec Bridges Board and of outside Bidders, to be subjected to the award of an independent Board, her terminy international in character

FUEL ECONOMY AND OUR NATURAL RESOURCES

ECONORY AND OUR NATURAL RESOURCES

IE problem of preserving the natural wealth
of the country may be attacked from two
sides, the legislatho and the mechanical.

The operation of the first method may be The operation of the first method may be seen in the admirable movement of the Federal govern ment to prevent the ruthless waste of the country a natural resources which results from the improvident muticods by which they are gathered from mine, field, and forest (full posterity will be able to estimate at and rorest Only peakerity will be copic to estimate at lis full value the revent logislation for the conserva-ion of that natural wealth with which the United States has been so richly endowed But after the fostering care of the government has

done all that it may to conserve by the prevention of waste it remains for the consumer to so utilise the m the maximum raw materials, as to obtain from them the maximum amount of metril output, whether in the form of power or of finished product, with the teast possible amount of wastage. This indeed, is one of the most impor-tant and attractive objects of effort in the great industrial world. To the engineer of high professional in stincts it is not sufficient to do a certain work and do it fairly well, rather, it must be done with as close an approximation to perfection as the conditions of

Economy of performance has been the constant alm of the industrial engineer, particularly in recent years, and from time to time we have recorded in these usees certain successive steps some of them in these pages certain successive stops some of them people making in their importance in this constant on deavor to bring working sfficiency into closer approxi-mation to theoretical efficiency. What we have said applies with particular force in the field of steem on efficiency in which it may be said that at the last sanipists the object of all improvements is to lessen the consumption of fuel for a given amount of work. Fuel concern, moreover apart from its direct connection with the profit and loss account of any industrial enter prize has a most important bearing upon the question of the conservation of natural resources. The world's consumption or natural resources. The consumption continuous as it is at present is increa-ing all an accelerating rate, and every reduction that is made in the average amount of fuel which must be burned to secure a given amount of work means that the life of our cost and oil fields by protonged to exactly that extent

At the present time there are two important develop ments which promise to give economical results who cases they have to do with the transportation of freight in bulk, the one relating to the engines of slowspeed curgo beats the other in the motive power of those freight Irains which are so characteristic

The reduction in the cost of transporting water barne freight has been made possible, or soon will be by the successful application of mechanical reduction by the successful applies also of me handes reduction great to arga ships of modernic speed—a problem to which some of the abless engineers and the most removed menufacturing firms in the world are now divoting close attention. Mar Farland and McAjinto, and Westinghouse, in this country, and the Hon Charles Parsons in Ninghand have independently produced a great which will resubtle side and moderal-speed steam ships to utilize the highly economical fact running stream thruther for first gain overgood propellers with a loss of efficiency in the transmission great or only two loss of the contract of t per cent. Parsons has gone so far as to test the new installation against the old reciprocating engines. In a cargo ship of 4500 tons displacement, and he has proved in a series of comparative tests that the cargo ablp of the future can be driven at present speeds with a saving in the roal bill of from 17 to 20 per cent Now since about two thirds of the world's shipping are made up of freight stramars, it can be seen that when some form of this system has been generally applied, as it undoubtedly will be, there will be a great aggre reduction in the consumption of fuel by the world's merchant marine For fuller information re-garding this epoch making device, reference is made to articles published in the SCHNTING ARTHUAY of Feb-

article published in the Scientific Article published in the Scientific Article 2018. April 23rd of this year Rousily important are the comomies in the transportation of rational region which are now reader possible by the perfection of appliances for the use of superheated heart Although the application of superheat has been practiced for several years in Europe, its of comparatively revent introduction in his country, but although our engineers have been a little later in taking hold of the problem, they have done with the country but although the country but although our engineers have been a little later heading divesters roade, nood work that on one of our leading destern roade, not have the prophets and Saint Properheated steam the Atchison Topeks and Sants Fe, superheated steam is being used on a number of the largest freight enin being used on a number of the Jargest freight on-gines with competents success. It is garles of tests with two identical compound freight elegiass running over the same stretch of road utders identical condi-tions, one a 4-rylinder compound using extracted steam, and the other a similar drylinder compound with a superheaver of the Jacobs type added, the rupper-heter engine showed a decrease in oad, consumplied of 18 6 per cent for constant hard working on heavy mountain grades; it gave an average of 11 6 per cent more dry steam per peund of coal than the non-super-heater engine, and the boller and its accessories proved to have a total higher efficiency of 138 per cent. These figures were obtained by II MacFarland, the engineer of tests of the railroad who explains the remarkable recommits setured by the facts First, that superheated steam of high temperatures behaves semewhat this a gas, it being possible to extract a con-semewhat this a gas, it being possible to extract a con-tained place, accordir, that for the same cruciff in the vilider. But weight of steam required is less with of 19 6 non-cent for constant hand working on heavy -ylinder, the weight of steam required is less with superheated than saturated steam of the same pres-sure, and thirdly, that, as compared with saturated m superheated steam has greatly reduced the inclivity, and the amount of heat absorbed by cylinder walls is only a fraction of what it would be were the steam saturated. The details of this system of superheating as applied to iccomotives of the Mailet type will be found in an illustrated article publis In our lesue of January 29th of the present year

in our issue of January 29th of the present year important as are the economies that have been made possible in the broad field of transportation, they are exceeded in the even larger field of stationary engineer for economicated by the buge light and power plants ing represented by the huge light and power plants for municipal and manufacturing service where the utilization of the exhaust ateam in low-pressure tur-blues has made possible economies of from 30 to 100 per cent—this last result baving been attained at the

DATE DADITH THAT IN THE BURY STATE? HE French scientist G Le I

E French scientist C Le Bon doubts whether metallic radium exists. In fact, we are only medalite radium exists in face, we are only requalitied with the salts of the supposed metal such as the chlorido or bromide and the probability of its existence is deduced only from the presence of some rays of the spectrum and an atomic weight which is somewhat theoretical secinal that it has veried according to the observers. M. Le Bon has been of the opinion for eight years past that the existence of radium is doubtful. He considers that the properties of the supposed metal might be due to certain maknown combinations analogous to the equally suknown combinations which give plus phorescent to some of the sulphides it is observed panerscener to some of the sulphides it is observed in fact that a pure sulphide is never phosphorescent but when mixed with some traces of different todics it becomes brillianity phosphorescent. This point has been discussed in various papers presented to the Arademic des Sciences 11e had occasion to mention. his views about radium to the late Prof Molesan, and this well known chemist had in fact come to the same this well known shemlish had in fact once to the same-conclusion, having the files of separating radium from its compounds. Death overtook him before the could carry out these researches. A centh of a granupe of substance would be needed by a good chamilat, but probably neveral operations would be required in addi-tion. An expense of \$10.000 would be incurred. Use Le bin thinks intact from chloride of radium we would Le lion thinks that from chloride of radietic we would extract simply berlium and nothing more. The ex-periment, wen through transforming a body worth \$250000 a gramme into a comparatively worthless metal would be of great interest, for it would prove that radiosa livity which gives out considerable force can be produced by certain combinations

M Georges Claude of Paris brings out the follow ing points regarding the future uses of oxygen, ser ling points regarding the future uses of oxygen, se-ing that this latter is now being produced on a cou-mercial scale from liquid air. He shows that oxygen can increase by 40 per cent the yield of the reactions which serve as the base of the fixation of nitrogen by the electric are, and it can improve the manufacture of escope by nearly 300 per cent. Such results promise to be of great interest in many of the industries. The Belgian firm of Ougree Marihaye has recently ordered from the Paris Liquid Air Company three apparatus from the Paris Liquid Air Company three apparatus from the Paris Liquid Air Company three apparatus of 200 croic yards of pure oxygen per hour. Buch apparatus will be used for apperments in biast furnace working, to observe the action of a considerable province of oxygen intaced with the fair, which is sent into the biast furnaces. As to the price of axygen, although the may be comparaturely high when yet consider only mostly quantities, the result changes when we come to under sayme apparatus of the plessent with the province of the control of the price of in which no less than 1,000 cubic yards of me jet-bour can be produced, whiching is a pressure of 10 stracephere and fermining 1.5 cubic yards per feering power hour. In such case the typic per cubic yard, will fall as jew at 8.5 cept. By using hybright gover, the cost of production sits a legilit jowered. Chrigae-phants of the pressing first yill be of great advances; the two way of manife since comparing complete in medi-factory comprehen the complete complete factors and factory comprehen the complete complete factors and factory comprehen the complete complete factors and carried house for preferred to the complete complete factors.

The Porhydrometer—An Apparatus for Weighing Ship Cargoes

BY THE ENGLISH CORRESPONDENT OF THE SCIENTIFIC AMERICAN

An ingedious apparatus has been perfected by an Italian sugineer, Signor Emilio de Lorenai, the University of the American State of the
The spiration of the instrument is based upon the principle that a body floating in a liquid no miles principle that a body floating in a liquid no miles what it do noily may be displaces a quantity of that inhule caractic qualt to its new neight. The apparent comprises merely a float or "aerometers" placed in a combre flit of with, actr, white is in communities when the outside of the ship. Consequently, as the vessel states deep rim to the water white being tools are stated on the state of the ship. Consequently, as the vessel states deep rim to the water white being tools and in the level of the water in the float channer must rise of all in calcidence with the feet in the surrainating liquid in the decision. The ship is the state of the water in the floating that there is not a float their being float live becomes more rises deeply immersed in the water in the chamber with a consequent siteration in the apparant weights.

The accometer is connected and belianced by levers so that by the adjustment at the balancing weights of the values of valer displaced by the accometer at any operational or manufact is accurately gazed the alternative and in apparent weight leading read on the weighting machine nor recording instrument and therefrom the veighting machine on any cargo taken an board or disclosured is castly determined.

The principle of the apparatus may be more comprehensively realized by reference to the expinantory illustration which above the mid-ship section of a rease-with the hopership of the mid-ship section of a rease-with the hopership of the mid-ship section of a dealer of the ship of the said transverse center of the ship and extends from a point 1½ to 2 feet below the line of finishing when the result is map; to a convenient in high above the food line. This chamber is connected to the surrounding state of the said of the vessel, or in some other convenient sea water connection a special tube being unnecessary to the some of the connection of the said of the vessel, or in some other convenient sea water connection a special tube being unnecessary to the ship of the said chamber can be secured so that the water jewel within may be egat by as that outside the ship in the later way to the said to the vessel as the ship in the later was the said of the vessel as the ship in the later was the said of the vessel as the ship in the later was the said of the vessel as the ship in the later was the said of the vessel as the ship in the later was the said of the vessel as the ship in the later was the said of the vessel as the said of the said of the vessel as the said of the vessel as the said of the said

ascentier? I beling suspended from and balanced by a notinguist lever. D having its future at E to ther end beling connected to a steelyard weighing machine at F The arcometer is generally machine the important and the second of the their limits of the second of the condition of equilibrium. The float actuals do not the second of floating, and of floating the floating, and of floating the second down the place for the maximum draught. Moreover, the profile is such that the area of the float at any point of cross section bears a constant ratio to the area of the which the same level

As the vessel becomes immersed through the superimposition of any weight such as cargo, the draught facereases and accordingly the value in the float chamber rises to a lighter lovel, the aerometer itself consequences being influenced devices and the superimposition of the superimposition of the superimposition of the lover, where a countriveleght remains usalitered As the steel year of the flower, where a countriveleght remains usalitered As the steel of the superimposition of the lover, where a countriveleght remains usalitered As the steel of the superimposition of the lover, where a countriveleght remains usalitered to the min lever D and the superimposition of the lover in the superimposition of the lover in the superimposition of the balance on the main lever of the balance on the main lever through the increased displacement.

The vital part of the invention liss in the acrometer Alteration of trim or inclination at the vessel cannot by any means appeal the ac curacy of the instrument it is in short an absolute gape of the vessel said subjected right aft or forward it.

if placed near the center of the vessel, since the draught directly under the instrument is the mean of that fore and aft. The whole of the parts of the apparatus are standardized with the exception of the arometer, which must be proserly designed and carrfully adjusted, its form being made to correspond with that of the ship.

THE REW MITTEL PROTOGRAPHIC MELICULARY.

Besquer, in order to measure the luminosity of the subs's disk, allowed a beam of sunight to enter a dark rooss through a small aparture, behind which a converging less was placed. The divarying once of rays, beyond the focus of the less, was intercepted by a cream, forming a circle, the brightness of which was not too great to be measured to be the sam was assumed to bear the same ratio to think any was assumed to bear the same ratio to think any was assumed to bear the same ratio to think any the same ratio to the same was assumed to bear the same ratio to think any the same ratio to the same ratio that the same ratio to the same ratio that the same ratio to the same ratio of the same ratio of the object gians. Finest and Foucanit received the image of the sum on an induced plate of aliver. In successive experiments they varied received the image of the run of an include place of silver. In successive experiments they varied the aperture of the objective and regulated the duration of the exposure so that the final tint assumed by the plate and, therefore, the quantity

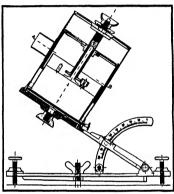

assumed by the plate and, therefore, the quantity of silver folded excomposed, was the same in each case. In this way they proved that the required integrated inversely in proportion to the aperture of the objective. In other words, the total chemical effect was found to be (within the range of expoure) proportional to the total quantity of light received by the image for the provided by the image for the provided by the total quantity of light received by the image during the exposure. Thus, by comparing the image of the sun with that of a circular area, of the same apparent diameter, of the positive carbon of an electric layst, they proved that the chamical diameter, of the positive carpon or an elec-tric lamp, they proved that the chemical effect is proportional to the brightness of the source of light. This relation, how-ever, did not appear to extend indantiely, for the quantity of silvar reduced, which

ever, did not appear to axtend indanististy, for the quantity of silvar reduced, which was at first proportional to the length of the exposure, bended toward a fixed limit in 1811 the great advance which had been made in photography cashled fansess to employ very sensitive plates, in which the total chemical effect remained preportional to the duration of exposure within very wide limits Jordan devised remained preportional to the duration of exposure within very wide limits Jordan devised crystaffers but containing a sheet of ferrogram of the containing a sheet of ferrographs action of the solar rays. Campbell, on the other hand, made one of the heating affect of the solar rays for the purpose of measuring the effective absent terms of the containing which the sun is not valied by clouds, a quantity which plays as important part in the processes of vegetation. Campbell's heliograph consists of a sphere of fishs, mounted on a horizontal

tation. Campions belonging consists of a sphere of gitas, mounted on a horisontal base, in a place exposed on every side, so that the sum is visible from its rising until its setting. A groove in the spherical mounting allows the intro-

profiles thus obtained are assembled radially about a verikal axis in their proper relative positions. By filling in the intervals with a plastic mass a fairly silling in the interests with a plastic mass a fairly complete skeled of the figure is obtained. This process may be raticle as follows: A mass of day or modeling was is placed on a rewiring circumpara-plations, the circumference of which is divined into teastry four complete arts. The approximant form of the model having feen given to the mass by the usual methods, the outside of the figure in one of the fentire) photographs is followed with the tracking point of a pantograph, which is so constru

joint of a paniograph, which is so constructed and arranged that its colying point plows a furrow in the mass of tay. The platform is then thread through one division and a second furrow is made from the sevend photograph. This process is repeated with each of the twenty four photographs, and the clay between the furrows is carefully removed. A very sailfully hand in required to perform this operation so as to reproduce were deadly of the model, but the object of this and all other processed of photographic and the second of the control of

camera, before a triple mirror, by means of which the

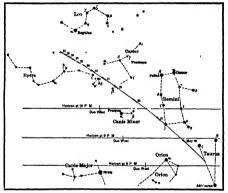

tion As the sitter's face and the three virtual images formed by the mirrors are unequally dis-tant from the lens, the four imtant from the iens, the four in-ages formed by the latter are not in sharp focus in the same plane For this reason the ground glass focusing screen is made in four sections, and the plate holder is contrived to hold four plates, side contrived to hold four plates, side hy side, but in nlightly different planes. The same cause produces differences in the scales of the four photographs, but in making the enlarged copies which are emin the operation of model ing, these differences are easily removed with the aid of the plummets which are suspended above and at each side of the sitters head, and which appear in each photograph and indicate

The modeling apparatus is shown in Fig 1 A vertical post rises from the center of the rises from the center of the square iron platform 8. Two photographs, a front view T and a profile B are supported in a vertical position by frames which slide in guides bordering two ad jacent sides of the table These sides are furnished with jointed

sices are furnished with jointed supports with carry long rods.

A and B The rods can slide TRACE lengthwise in their supports and can be inclined and mored vertically and horizontally by means of the joints of the supports. The rods are ny means or the joints of the supports. The rods are used horkontally if the buss is to have the same scale as the photographs, and are inclined for en largements and reductions. The movement of the photograph frames in the guides is limited by fixed atops, so that the frames can be removed and replaced exactly in their former positions The rods and their supports are adjusted to bring

The roos and their supports are adjusted to oring the inner and of the rod A into contact with a con-spiration point, the tip of the nose, for example, in the full face photograph T and the inner end of B into contact with the corresponding point of the profile E The frames containing the photographs are then removed and the rods A and B are pushed inward in their supports until their inner ends meet. The point of meeting determines the position of the top of the nose of the hust. The post at the center of the table is covered with clay or other plastic material, which is built out until this point is established in tangible form The rods are then drawn back, the photographs replaced and a second point of the face in established replaced and a second point of the race is eccasionses by a repetition of the process. In this way numerous points distributed over every part of the bust are fixed, each pair of adjacent eldes of the table, and the corresponding pair of photographs, being employed, as required. The result is an aimost complete sketch, ed from a sitting of a few seconds. All of the operations can be performed by a skilled workman The hand of the sculptor le called into requisition only to give a few finishing touches in another bris sitting, and to impress as individual artistic cha acter upon the work.

The tail will extend upward and to the left, practically along the line of the comet's apparent path. How long it will be it is even yet impossible to say A fract the light of the moon (which is full on the night of the 25rd) will drown out the fablar parts of the tail, but laker, when it is out of the way, these may privace be seen, though the comet will be no such farther not flat, on the whole, it will hardly be so fine a sight,

In observing it telesconically the ave est power, giving the largest field of view, will be most milisfe

sten University Observatory

The Electicity of the Earth.

The Einstein of the March.

Bone interesting experiments have resently been carried out by Prof Miles, F.R.S., the well-known authority on sainmology, to demonstrate the visaticity of the earth especially under the influence of the tides.

Some years ago he showed that valleys during the day are of greater with than at night, there being an expansion or opening out under the action of the sun and a contraction or closing up in the hours of darkness. He also showed by means of seismographic records secured at his observatory at Shide, that the

Wireless Telegraph Apparatus for Contestants of the Glidden Tour

BY RENÉ HOMER

In the district selected for the annual Glidden tour this year, ordinary telegraph communication will be very difficult, and at times impossible. In 1995, a though the thur passed through a comparatively wellthough the tour passed through a comparatively well-settled country, the wherehouts of several of the con-testants were often unknown for hours. One car, for instance, failed to report at the night control, and no nee knew what had happened until the naxt morating that had happened until the next morning commion a passenger was injured in an

mboo serial set up in our.

accident, and nothing was known of the matter until it was reported by a belated tourist at the night check ing in Many minor difficulties were responsible for considerable delay that could have been prevented if the cars had been in communication with the last

The Chaimers-Detroit Company propose to keep in The Chaimers-Detroit Company propose to seep in touch with the contestants by means of wireless toleg raphy Complete plane have not been worked out yet, but it seems probable that some such acheme as the use of three field wireless stations will be favored, two of of three field wireless stations will be favored, two of them being in touch with the wire system, while the hilled in touch with the wire system, while the hill station is being established at some advantageous that sheed of the contestants. The exact details of the plan will be furnished after a trial can be had at chance to go over the worst portions of the proposed route. In the early part of March successful wireless telegraph tests were made for the Chalmere-Detroil Company between one of its cars in Central Park, New party between one of its cars in Central Park, New and 47nd Street. Thus the Detroil of the Park Aronse concludit to these miles to the trial from a northest section.

one-half to three miles in the trial from a moving car, whila the experiments with the portable field stations showed that this type of apparatus at least would be able to carry on certain communication up to fifty miles, as the field station was able to keep in com-nunication without any trouble with the Metropolitan and Manhattan Life towers and another wireless station at Newark, N J Later, communication was maintained between a car on the New Jorsey highways near Trenton to the "sparkless" wireless at

tion on the Land Title Building at Philadelphia, nearly thirty miles sway.

The receiving station for running automobiles comprised a 7 foot serial in connection, through a loose coupling, with a variable and a fixed condenser, a detector of the aution type, telephone receivers, and a bigh and low voltage bettery The sending set comprised two storage cells, a 10-lach spark coll, two Layden jars, and a "ly-jinch "radiction discharger" similar to those used at the Micropolitan and Mandillar the state of the s

hattan Life stations. This apparatus, which worked acconsentity up to three miles, the furthest distance tried, would sprobably operate for several miles far more than the control was soomed by drawing between the rear wheels a heprical tabling frame supported on middle space being occupied by three Schoel steel wheels with silks bearings arranged so as to allow the weight of the wheels to keep them in contact at all times with the read On the macedamized roads of the park this system of grounding worked fairly well, although on like sandy roads of Now Jersey, where the subsequent tests were made, a great deal of difficulty was experienced in properly maintaining the ground the same properly maintaining the ground the subsequent tests were made, a great deal of difficulty was experienced in properly maintaining the ground the subsequent tests were made, a great deal of difficulty was experienced in properly maintaining the ground the ground the ground the deals with the ground the gro

ran only about ton miles an hour Field stailons which can be put up in five minutes can be operated more successfully and the same appa-ratus used in the automobile by stopping the machine and securing proper ground has a range of about ten miles. The sending circuit of the field stations used in the longer distance tests was the same as that of the moving stations with the exception that three storage ceils instead of two were used, and another 10-inch spark coli was connected in parallel with the first coll, so as to be operated from the same key

first coil, so as to be operated from the same key This gave a range of about fifty miles

The field sending station was provided with a 100-to serial second at one end to a spreader statehod to a 48-foot hamboo tolescope must and heading down diagonally to the top or a 12-foot must about 90 feet away and thence back to the sireless apparatus about midway between the two poles.

Two of the photographs about the first successful coil, in which a 35-foot serial and a 5-foot head of the total coil sectuated by one strong coil are tased. With this coil sectuated by one strong coil are tased. With this behalf with the higherstory of 400 first first-about one head of the total coil are tased by the strong coil are tased.

be held with the laboratory at 42nd Street, about one

be held with the laboratory at 22nd Street, about one and one-half to two miles away In the more recent tests additional condensers star age cells, and audion receiving accessories were used The closer view shows a radion detector in use (to) of the box to left) while a perikon detector is shown nuccied on the table in front of the other appara.

The box upon which the operator is sitting con-

tains the interrupter, spark coil, and discharger, which are inclosed on account of their delicate nature and because they have not yet been protected by patent in the newer station all this apparatus is carried in the antomobile, and there is no necessity for setting up the apparatus on the ground although the scap box does indeed make an admirable table for a wire-

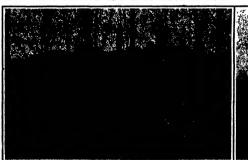

ss station In the coming tour it is proposed to send two scout

Automobile wireless equipment,

cars ahead of the regular contestants, each one of which will carry the complete field set of oven greater range than that which every car can carry Point where the telegraphic facilities are poor or impossible where the telegraphic facilities are poor or impossibles will be picked out and the two cars will arrange to be at stations at these points just abend of the pitch car one station being equipped for business while the other is taking care of the telegraphic business of the tour In this way one of the two field stations will be in operation all the time, while the other is being set up at the next point along the route

sirous as the floods in France have proved for Disastrous as the finode in France have proved for the railways, a worm disaster occurred one day last winter in America. Three days previously a warm wind arose in the State of Newside so suddenly as to neit all the snow. The result was such a torrent as to entirely was away 100 miles of the San Pedro. COMPLETION OF THE PERMITURANTA RATIDOAD TURNELS AND TERMINAL STATION.

As late as the year 1901 the Pennsylvania Railroad was employing ferries to land its passengers in New York city just as it did in 1871, when it first leased the United Railroads of New Jersey Ten years ago the United Railreads of New Jersey Ten years ago the system was hauling freight to Eastern cities over practically the same heavy grades as were to be en-countered in 1875 To-day the company is completing a monumental improvement in and around New York a monumental improvement in an around wew tora city which will enable passengers to travel from east ern, western and Long Island points direct into Man-hattan Ieland, arriving at a railroad etation which, for convenience and for the beauty and dignity of its architectural appearance, probably outranks any similar building in existence.

air building in extence.

During the past ten years the company has epent an enormous sum of money in straightening out its time to the East, and in cutting down grades, and in a few months' time freight trains which are already a few months' time freignt trains which are airoady traveling over the new lines, on which they encoun tor no grades greater than tweive feet to the mile, will be run direct to large terminal wharves on the New Jersey above of upper New York Bay, and for

the original struct surface, extend from Tenth Armine to Serenth Armine, From Tenth to Nitet Armine to Serenth Armine, From Tenth to Nitet Armine the yard congress encer than the area of a city block, and from Ninth Armine to Serenth Armen the hope contraction correst the whole width between Thirty-first and Thirty-third Structs. The extension correst theoretics over the other largest city blocks, and it involved the removal of over \$0.000,000 colib rarks of materials. Proceeding easterly from the terminal yard, material. Proceeding earlerly from the terminal yard, the tracks, four in number, are carried below Thirty-second and Thirty-third Streets to the East River, under which they pass in four separate these. The grade descending to the river is 1.5 per cent, and the sacending grades to Long Island are 0.7 and 1.23 per

cent.
The new terminal station located between Thirty-first and Thirty third Streets, and Seventh and Eighth Avenues, is a truly magnificent structure, built of grainite on classical lines The terminal work was carried out under Mr George Gibbs as chief en ried out under Nr. George Gibbs as chief engineer, to whom we are included for contrasted outring the pre-paration of the present article. The main entrance to the station, on Seventh Avenue, leads through an ar-cade forty-dwe feet wide by two hundred and twenty-fer feet long, to the main wetting room, which, with its width or 108 feet and length of 177 feet, and clear height of 150 feet, ranks as the largest in the world. Just what these dimensions mount is shown by our front page engraving, which portraye the central por-tion of the New York City Hall with its tower, standing on the floor of the waiting room, with the top of its flag pole failing to reach the roof by fully ten feet.

HOW TO BUILD A HOUSEBOAT FOR \$800.

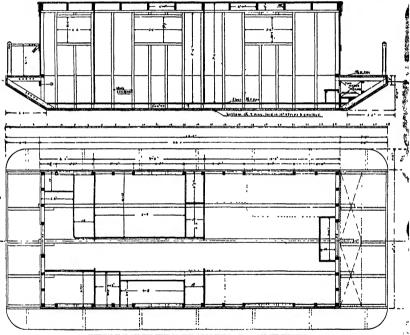

NOW TO BYILD A ROUREDAY FOR \$800.
The proposition of spending a summer affect is one which appeals to many persons fond of the water, but the cost of a year his targe enough to accommodate controllarly a family for a protracted period in prohibitive to the majority, therefore people swelter ashers in her and uncomfortable locks, and smatch such as-

during the summer season under equally comfortable conditions. The cost of the boat would vary, according to whether it was built by amateurs and how elaborately to whether it was built by manacers and now emportantly it was constructed and fitted up A moderate price ahipbuilder should build this boat complete with toiled and water tanks for five hundred dollars. At the boat is very simple in construction amateurs should be able to build it for about three hundred dollars. At a small additional cost an avaning could be rigged over the house-top, thereby providing a fine, large, cool lounging space.

For those interested in building such a boat them-selves the following hints on construction may prove maful

The first step in construction is to prepare the ground and build the sides and bottom of the hull The ground and build the sides and bottom of the hull That ground should be prepared by driving posts and using stringers and blocks so piaced that the bull may rest during construction on an absolutely level plane By doing this a level and plumb line can be used to get the house and its compartments built plumb and true After the building foundation is prepared, start by

so that they trend on the minds and are open about \$\frac{1}{2}\$ into counted. This is to allow the extitivity to be driven in and to provent it behing peubled clear through to the inside. In puriting the hull together we large plavament or noce in Board and the foreign and the better plant. The corner lot. A should be finesheed to the sides with \$\frac{1}{2}\$ to the purished from trives, and the bottom plant-careful that the planking fise perfectly flat and true obsore fractanting, otherwise leads will surely denote, which are hard to stop. Faint should be applied and frow threads of cotton intel along the oldge of the belief to help make a water-tight job. After the bottom is extrem \$2 \times 1
It might be well first to call attention to the two water tanks that are shown in the drawing. If these are to be put in it is well to do it now, otherwise some

SECTIONAL PLAY AND SIDE VIEWS SHOWING CONSTRUCTIONAL DETAILS OF THE MODIFICAT.

A solution of the problem of fiving cheaply and A solution of the problem of fiving chesply and comfortably fished is found in the househoat Buch a life ofters many charms and advantages. It is gitter-ally cooler on the water, and the lat is arresher and better being free from dust and land smella. Bishing a siraway "on itso," and the solution sirriery chain in a regard summer total if the locality becomes tire-some the louis-boat can be towed to another harbor former than the control of the control of the con-trol of the control of the control of the con-trol of the control of the control of the con-trol of the control of the control of the con-trol of

for a few dollars and there is no packing of tranks or tipping of evertast when getting out of town. The plans herwith shown represent a small house boat results of accommodating four or five persons comfortably for a very moderate price. It would cost four persons fifty dollars a week at an average-priced summer botte! This amounts to six hundred dollars of the months, without cartras. The heat shows four persons stry doubtes a week at an average-prison-summer hold. This amounts to six hundred dollars six three months, without extrus. The best shown there could be built for less than that Then at the end of aummer it could easily be sold for more than half its value or kept for another year. In any case there would be a very large saving over living salery

TO SIDE VIEWS RECOVERE CONFERENCESSEL DETAILS OF T getting out the sides. These are of 1½ inch yallow pire, laid three strakes to a side As the depth of the bull is 30 inches the sum of the three panks should be a side of the side of the side of the bull of the three panks and the side of the wood secowed to them. When thus secured fastes on the lower inside edges a yallow pine corner log 2 x 4 inches as shown in the cross section pine at A The object of this is to siften the odge and seford extra nailing surface for the bottom pine in New set up the sides in their proper places on the bullding franca-tion and be very careful to see that they are perfectly plumb and level, otherwise the whole streptures will be croated. Nail three or four strips across the bottom plumb and level, otherwise the whole streptures will be croated. Nail three or four strips across the bottom of the bull. TWO POYEL MOTOR OLD

Who heven more makes.

'Questioned you need not be topologe the ground, appears to state still, while he solich sitilise over it. This is the motion that actually those place, for the top of the chain travels forward at rwice its speed of the sieigh. It will thus be seen that in resulty the lower part of the chain in contact with the

part of the chain in contact with the ground constitutes as unrise over which the vehicle itself can move. The driver has his position on a box behind the engine, which seat forms a receptacle for tools, spare parts and other accessories. That the vehicle has great climbing power has been conclusively proved, for it will ascend steep banks of earth and ride over serious obstacles castion in speed

Although this sleigh can carry a party and full equipment, its actual func-tion is to act as a tractor for the haulage of ordinary sledges, the trailing ve hicles carrying the loads. Upon comple-tion by the builders, the tractor was taken to Norway by Capt, Scott, and sub-mitted to some exacting trials on snew covered Lake Fefor and the tumbled covered Lake Fefor and the tumbled country in its vicinity, where the conditions were somewhat manageous to those prevailing around the south pole. Heavily laden trailing sledges were hitched on the tracter and numerous journeys were made among the Norweglan less fields. The vehicle proved itself fully capable of withstanding rough usage, and Capt. Roott spreased his complete satisfaction with the results achieved. Very different from this side in desire

Very different from this sied in design Very different from this sied in design is one which has lately been put to a series of severe running tests over all kinds of ice and snow in the district of the Silian lake, Bweden The accompanying photograph of the motor steleth was taken in the Easter days of this year, after the above-mentioned tests had een carried out.
The design differs from that of other

The design differs from that of other automobile sielghs in the driving mechanism. The sleigh is propelled by two driving wheels, each fitted with a number of steel paddles between which an elastic frame is fixed. This simple construction thus combines the advantages of a paddle wheel and the Canadian snow. struction thus continue the advantage of a paddle wheel and the Canadian mow shoe, having the propelling capacity of the former on fixed les and anow surfaces, and the supporting and friction capacities of the latter on loose sow The flexibility of the frame bands further of the paddle of the present the surface of the paddle wheels in case the snow to not compressed enough by the runners, the paddle wheels in case the snow is not compressed enough by the runners, the paddle wheels in the paddles engage with the compact snow by cutting through the runs task the paddles angue with the compact snow by cutting through the crust as knives, and worst on account of their breacht, against such a large wedge of the froses snow surface, that an effective counter presence is obtained with would otherwise during the paddles. The sleigh is in this transce driven by a 4-breas-power double-quinter air-cooled generate motor sleigh illustrated is designed to save only as a traction engine, to which active the states of the s

it is of course easy to make the motor sleigh as self-contained as an ordinary automobile, and the electrically-driven forejunners of this sleigh were success-

rovernmers of the seeign were successfully built in this way.

The motor sleigh is governed by means of a very ingenious and reliable stering device for remote hand operation.

The power required for steering is trans-

The power required for steering is trans-mitted from the operating hand-wheel through farithe steel tubes to the motor he the fastr a speed of M miles as hour over a smooth toe surface was attaled. When traveling over the mow and lea-dwared reads, which were in a very lead

The inventor is a Swedish engir Mr H. Hakanson

An Industrial Enboratory for the Im-provement of the Incandecent Lamp.

Although the establishment of a research laboratory by a large manufacture ing organization is not a novelty, the in-ception by such an organization of a lab ception by such an opganization of a lab-eratory which has for its object the devel-opment of science rather than the improvement of some industrial commod ity is probably without precedent. For that reason, MY E. F Hyde calls atten-tion is a recent number of Science to the name physical laboratory of the National Electric Lump Association, even though, even though it is still only in a formative state. The object of this laboratory is scientific, the specific purpose being the development of those branches of science with which the those branches of science with which the art of lighting is closely associated. The fundamental idea which has prevailed in the organization of the work is the proper co-ordination of physics and physiclogy, the proper co-operation of the physiciat, the physiclogist and perhaps the psychol ogist.
The organization of the inhoratory is

The organisation of the ishoratory is proceeding with this idea as the founda-tion. The development contemplates no sharp distinctions among the different divisions of the work. The problems to be investigated, however, group them-selves roughly into three classes, and therefore require, in order to insure the insersors require, in order to insure the proper attention to each, a threefold divi sion in the organization The three groups of problems to be investigated may be classified as (1) those that have to do with the pro

to do with the production of luminous energy, (3) those that have to do with the utilization of luminous energy, and (3) those that have to do with the effects of luminous and attendant radiation Under the first class will come the in vestigation of the laws of radiation, and of the radiating properties of matter. The problems in this class are purely physical

problems in this class are purely payaical, and the corresponding division will be intrusted to a competent physicist.

Under the third class will come the in westigation of the effects of light and the attendant radiations on the eye, on the skin and on microscopic organisms. The problems in this class are physiological and the corresponding division is under the charge of a trained experimenta

Intermediate between these two classes of problems (the first and the third) which are distinctly different, there is another (the second) which forms the connecting link. Touching on one side the shyrical production of link, and on the shyrical production of link, and on the shyrical production of link, and on the shyrical production of the work will ashbese most of the selentific problems peculiar to illuminating engineering. Investigations of the absorbing, reflecting and diffusing properties of mat for, the measurement of light, i. e, photometry, and the study of the complex of the control of the study of the complex of the study properly come within the scope of this epartment of the work.

Selection (tider Making, Measts, Alliet and Gimel recently pre-sented a paper to the Académie des Sciences concerning the good results ob-tained in the production of cider by wash tained in the production or cuer by washing the apples with an oxidizing solution inasmuch as elder is the usual beverage of the populations of the north and west of France, its manufacture should concern hygienists as well as technicians. In many argument as went a tennerans. In many cases the quality of the product is much inferior to what it should be were the process well carried out. The washing of the apples is indispensable to free them from the imperities which they carry, but from the impurities which they carry, but we must also take account of the defective quality of the water which is available in many cases. The authors' previous re-(Concluded on page 498)

THIS VANADIUM STEEL GEAR BLANK

is 5% inches in diameter and was bent cold-flat upon itself as shown. without a sign of a crack or fracture.

Vanadium is an elementary metal; it melts at 1600 degrees 1; alloyed with iron in the pro-portion of one to two, it melts before the fusing temperature of iron or steel, and as Ferro-adium may be thus added to the foundry la the open hearth furnace or the crucil n iron or steel

When so added it combines with oxyge nitrogen and removes these gases in a fusible slag, making the remaining metal dense, nonous, homogeneous and stronger to a nurked

crosses the tensile strength and elastic limit of steel, it maintains the ductility, as may be seen from this experiment

A pocket knife with a Vanadium steel blade will cut chips from a steel spike. A carpenter's saw of Vanadium steel will cut through a two-inch gas pipe unharmed. Locomotive cylinders of Vanadium cast iron wear five times as long as ordinary iron without reboring. Forgings from Vanadium steel ingots are the strongest, most elastic and longest lived forgings possible Vanadium steel springs, owing to their freedom from crystallization, wear three times as long as carbon steel springs.

You are getting only partial results if you don't use Vanadum steel. Its marked wearing qualities commend it as the only material for railroad switch points and crossings, high-duty parts of all machinery, springs, gears, axis, and all forgings.

AMERICAN VANADIUM COMPANY 331 FRICK BUILDING PITTSBURGH, PA.

(Concissed from page 407) searches showed them that oxidizing agents could be used to advantage, and they experimented with hydroxyl, oxonised water, and hypochlorites of soda exonised water, and hypochlorites on some and of lime in solution in the water which is used for the washing. Used in the pro-portion of 40 to 60 centigrammes per liter er (04 to 06 per 1,000), which is more than enough to destroy pathogenic germs of the human species, they find that hypothlorite of lime has a good influence the activity of the pectase, which is the congulating dissiance of the pectic matters of the juice of apples. Where the fruits arry much impurity they should first be washed in ordinary water before immersing them in the oxidizing solution The teste carried out first in the laboratory in teste carried out first in the laboratory in 1905 were pursued in the cider-making districts during the seasone of 1907-8 and 1908-9, and they led to the following concinsions First, the addition of hypochlo-rite of lime in the above proportions acrice of line in the above proportions ac-cording to the state of purity of the fruit, assure the purifying of the doubiful wat-ers as to bacteria for the present purpose ers as to cacteria for the present purpose. The juice of the fruit thue treated is found to cisrify rapidly. The coagulation of the pectic matter is always well carried out and we have formed an abundant brown eurface layer. This assures the stability and we have returned the stability of the cider with time in this respect. The disatases, especially the meloxydase, are eliminated by precipitation, so that we avoid the principal cause of darkening of the cider. It is also found that the hypothesis of the cider is also found that the hypothesis and the cider is also found that the hypothesis and the cider is also found that the hypothesis and the cider is also found that the hypothesis are the cider is also found that the hypothesis are the cider in the cider in the cider is also found that the hypothesis are the cider in the cider the cider It is also found that the hypo-chiorite has a favorable selective action on the Baccharomyces mail and a destruc-tive action on the anseroble germs, and it thus solves practically and simply the thus solves practically and aimply the problem of a pure formentation By adding to this treatment the method of repeated underdrawings, we can obtain closer which will keep much longer, and this is of interest for producing bottled older. There is no harmful matter introducing the second of the second or the second of the older There is no harmful matter intro-duced by the present process. Compara-tive analysis of cider made from treated and from untrated apples shows a marked advantage in favor of the former.

Rithery Kites, as well as dirigibles, captive balloons, and soropianes, may be made serviceable in military scouting, and their empileity makes them especially valuable. Furthermore, they can be emvaluable. Furthermore, they can be emplored with any velocity of wind between 16 and 65 feet per second, whereas the use of a captive bailoon becomes difficult if he velocity of the wind exceeds 26 feet per second Experiments recently made at Boulompe by Capt Baconney show that it is quite practicable to carry two persons by means of a large kite. The kites used in his experiments were of the Cody type with four sustaining planes and with triangular stabilising wings In this method of construction wings in this method of construction each rectangular cell is strengthened by diagonal reds of bamboo to which the stabilising wings are attached. The ap-paratus consisted of a series of kites conparatis consisted of a series of after con-nected together, for the purpose of sup-porting the cable, and of a second series of kites attached to a very light carriage, which moved along the cable, and from which the car or basket was suspended

which the car or basket was easyended Kilcs can nearly always be used at sea and on the coast. They are simpler and less expensive in every way han bullcoms and they are also strong and easily repaired. These qualities should make them valuable for many purposes in military and especialty in naval opera-

A wireless telegraphy station near Berlin claims to have established a record in combined overland and sea transmission of wireless messages. The station recently succeeded in maintaining wireless communication with a Woerman iess communication with a woermann illner during the entire voyage from Hamburg to the Cameroon The greatest distance signaled was 8,600 kilometers (over 4 000 miles) Although messages had to pass over the Alps the Algerian tablehand, and the Adamana Range, com-Garden Notes murcinsu, and the Adamana Range, com-munication was, it is stated, effected with astonishing case,

THE BUSINESS MAN'S TRAINS

The man of affairs when he travels wants all the conveniences of his club. He will either carry his business on the train with him, or make his trip a recreation. In either case the Limited trains of the Penns hanna Railroad meet his requirements. If he wishes to talk business en route, a drawing-room or state-room supplies the private office. traving-room or sate-room supports the private onte-the wishes to finish up some left-over correspondence, there is a stenographer at his elbow to do his building without charge. If he wishes to keep in touch with the market, he has the stock reports, which are telegraphed to the train. Mapy business and professional men take advantage of these

If, on the other hand, he wishes to forget business and take a mental rest, he can do it in a luxurious manner, and take a mental rest, he can do it in a luxirous manner ununded by tasteful appointments and all the things that his club supplies for satisfying the inner mai. There are books to browse at, periodicals to skim over, and beyond the wide plate windows an ever-changing picture of nature in all manuer of environment. This is restful and at the same

all manner of environment. This is restful and at the same time engaging.

The quintette of Lamiteds, led by the "Pennsylvania Special" (the 18-hour train between New York and Chicago), "The 24-Hour St. Louis" (fast evening train to the Southwest), the famous old "Pennsylvania Lamited" (the Pioneer of the Lamited's to Chicago), the "Chicago Lamited" (evening train to Chicago), and the "St. Louis Lamited" (the afternoon train to the Southwest), are all expressive composed for the use of the bissuess man and the expressly equipped for the use of the business man and the traveler for pleasure

KERITE INSULATED WIRES AND CABLES

ARE BEING INSTALLED TO OPERATE THE ENTIRE INTERLOCKING AND BLOCK SIGNAL SYSTEM

of the Pennsylvania Tunnel and Terminal Railroad Company

NEW JERSEY

NEW YORK

LONG ISLAND

- ERITE has back of it an unequalled record of half a century of successful service under the most adverse conditions. It improves instead of deteriorating with age.
- E fficiency and safety in electrical installations depend chiefly on insulation. KERITE
- is more dependable and will outlive any rubber and mineral insulation made.

 R esults have demonstrated the superiority of KERITE. The only real test is the test of time. KERITE wires and cables installed half a century ago are in service today.
- I nitual tests determine the properties of an insulation only at the time they are made.
- They do not determine how well it will do its work years afterward.
- he rubber (a perishable substance) is the basis and limitation of all other insulations.

 Kente (an imperishable material) is the basis and gives practically unlimited life to KERITE insulation (the rubber being incidental).
- xperience of others should be useful to you. Long life and efficiency and not first costs mean ultimate economy. Insure your service by using KERITE.

NEW SEYSCRAPERS FOR OLD

A titel, modern indestrate conditions thing are done in a big way and often with a strong dash of the apertacular But the hely six-ler, alkelt b. is duly confronted with the unusual and the unexpected must confess some measure of surprise and parenting that a nudern abyseraper 300 feet in highly, and but a down year out is to be corn down to make way for a new structur which is to be several studies highly, and must a down year appointer if you presse fo the conservative Europeant of the property of the conservative Europeant of the property of the conservative Europeant of the property of the conservative Europeant Eu

The policy is purely utilitarian—buttally so if you like—a mere question of dollars and vents, but it is a good business policy nevertheless, and, in reality has been one of the most powerful foctors in bringing about the present phenomenal industrial development of the United States

Your old world engineer or architect with perhaps a stronger lines wie southerntain, healister to aweep a faithful seriant so remora leastly out of the way leastly the will point with his prider in his forty year-old toconcite with its utilities made a souther strop or two for a building, if this he possible reather than rare to the condations and build from the ground up It is a case of cash to bis a holt, though there are not want or many limited to the condations are southern engineers are besting many indications that little engineers are besting many indications that little engineers are besting many indications that little engineers are besting many indications that of the engineers are besting many indications that it limite engineers are besting many indications that it limite engineers are besting into practice in the development.

of their infantital enterprises. The different building which at ands at the north west corner of Nassau and Wall streets, in this city as a street-story selectrame office building which was completed in 1898. The countraction was first least, the foundation being outdown by the puter matter process and the site! from Lorengably braced to reside with and realize written. From street to create who and realize written From street to create the abtern stories a street to create the abtern stories a street to create the abtern stories at the create was the street of the initiality of the street of the treet and the processory tower desired to the street of the initiality of first streets and the street of the initiality of of

thoroughly painted at the mill, at the shops, and before it is inclosed in the building, it is absolutely proved against rusting and will remain intact and serviceable as long as the inclosing waits and roof endure Chaisle of rusting, there is no other known agency that tends to shorten the life of the steel frame of

Omittle of rusting, there is no other known agency that tends to shorten the life of the steel frame of hir modern skyacraper. Exploded long ago was the thousy of the fatigue of metal Simple statical stresses or even dynamical attents of frequent repetutions of the stresses of respect to the stresses and the stresses appreas the classic limit that the strength of the metal is imperited—saud in the modern skyacraper no such conditions exist. Ocraits imaginative magazine writers to the centrary notwithstanding, the visitor to New York five hundred or a thousand years better will find the skyacrapers of today in perfect condition, provided, of course, that the doctrine of the string constitution of the string the strength of the string that the doctrine of the string constitution of the string that the doctrine of the string constitution.

OUR WANT AS A MATIONAL INSURANCE.

A Tibe re-ent tames of the "Plerida," as the grant ship was assing down the way one of the troad was heard to remark 'Weath as shannful waste of public money it to was heard to remark the waste of the support of the two work for which abe was built, and that if she ever got a into a fight, ahe may be ent to the bottom within a two uninstees of the opening of an action. The remark was characteristic of the wasteriness of modern armaments. Taken by titled it to work earn to be convicing, but if we look at the question bready, and with that hous sense of the value and menting of things we shall see that proportion which is necessary to a correct cetimate of the value and menting of things we shall see that a buttlenhip mose the judged to relation to weat it sinds for and the work which it is intended to do in the last analysis the "Florida's in me elements in an extension that the transfer of and the work which it is intended to do in the last analysis the "Florida's in me elements in an extension of inhabitants of the United States.

The true test of the question of the extravagance of navi expeditures is to determine the ratio that they bear to the ninear value of the property which they proved. The following suffuniace of expenditures, which have been furnished from Washington show that the flart cont of the ships of the navy, as they float inday is roughly \$400,000 000, while the current names expenditured that the flart control of the minimal expense of their maintenance is about \$44,000,000 The cost of maintenance last year, including yad officers and enlisted men of the navy and marine corpu pilot dues provisions, elothing, ordanace cultiment, medical and machinery stores is including cost, water and other list identities amounted to nearly \$10.000 to \$100.000 and equipage of it he vessels amounted to nearly \$10.000 and equipage of it he vessels amounted to mach \$4,000,000 and high the combined expense of pre-

serving peac on one shures pearly \$44.000.000.

The amount involved covers the expenses of all the various types of our ships of war which include bat tleships armored (ruleers, cruisers secuts, the tor pedo flottlis insulinors, guitheats, supply ships, loopy in the peach of th

As an Example of the heavy expense of maintaining a big ship of war we may take the butterhip Connecticut which was the flagship of the Atlantic fierd during the last year. The pay of the officers and estimated nice of the navy and marine copas attached to the vessel and the expenses incidental thereto amounted to nearly \$800,000. This did not include the

With the increase in size of the hattlenkins, they is a corresponding outler for pay of the premoning, is a corresponding outler for pay of the premoning size of the premoning of the premoning outlet of the premoning of the pre

the United States.

If the show seems to be a strong statement, capable of easy proof. The latest estimate or waste of the United States variable in the Busin of Statistics is that of 1904, made by the Cenaus 9 17, or \$1,310 per capita. The 4's millions which his navy cost is at year may be regarded as the coupled hourance against damage and loss of that 107 Statistics are not succeeded by the coupled for the company of the statistic statistics of the company of the coupled the interest on the capital cost (400 millions) of sections of the coupled the interest on the capital cost of the "Plorida" 30 millions) which becomes on large in the eye of the capitons critic at her issunching dwindless to one one-many control of the capital cost of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for one pre-cent of the westils of the cost-underded for the cost

THE UTILIZATION OF SOLAR HEAT

If the heat of the nuus rays were entirely some verted into mechanical energy, it would furnish more than two horse-power for each square yard of surface exposed to the sun, but in practice it is difficult to utilize bolar heat. Attroppis were made in France by Woochot and Tellier in 1871 and it is difficult to utilize bolar heat. Attroppis were made bolar containing water or other vosaille liquid. But the mirror was contry and it gave only one bone power for 12 square yards of reflecting surface. Tellier, in 1885 caused the sam's rays to be absorbed directly by a insulate bolar, containing a limit intervolved of the sam's rays to be absorbed directly by a insulate bolar, containing a limit intervolved of water or more vokatile liquid, such as ammonia or carbon more vokatile liquid.

Justines also employs a fameriar botter covered with beautiful the same heated in this botter is used to experies the more volatile liquid ammonia or subjust districts the more volatile liquid ammonia or subjust of the properties of 100 square yarde of heating surface, furnished a mean power of 100 square yarde of heating surface, furnished a mean power of 15 horse-power. Williese estimates the cost of the appearitus at about 18 flop er squares yardened estevilates that it should about, at the 3th power and estevilates that it should about, at the 3th power and estimates that it should about, at the 3th power and estimates that it should about, at the 3th power and estimates that it should about, at the 3th power and estimates that it should about, at the 3th power and estimates that it should about, at the 3th power and estimates that it should about 100 percentage of the 3th power and would cost \$80.00 per cost of power to 400 horse-power however the total first cost per horse-power would be doubled. The cost of operation is about 350 cent per horse-power.

In experiments made at the agricultural station of Laumane Switzerland, for the purpose of determining the state of the st

PLECTRICITY

The conditions under which a street lamp should prove in afficiency are very different from those which govern the Indoor lamp. This was brought out clearly in a recent deferes before the New York Section of the Itiuminating Engineering Society by Dr. Clayron it Sharp. He pointed out that while in the building it is advantageous to have much of the light of a transcription of the state of the case of a street lamp this would be a great fault for the vertical rays would be lost. Only those rays that are cast directly downward and horizontally up and down the street can be utilised. For this reason has devised a reflector consisting of a pair of para bolk, mirrors arranged to throw the rays in the divention of the sever on that post-carright and of the high control of the contr

The block signal systems of steam realizeds have litherto bot no perstad with direct current from single batteries. a wider all! Mr Sanger Shepherd has fitted the appa into with a fine abutter, and in that case the receiver through the tunneled poles of the electro-magnet, and a pair of narrow commensated selentum cells is pisced tind the siit, a positive lens being interposed dot received shifts the fiber laterally, light fails on the seienium cells, and their reduced resistance allows a battery to actuate a relay which throws the tale photograph receiver into circuit

HOW THE "PLORIDA" WAS LAURCHED

The issue bing of the 'Florida,' which took piace strictly according to schedule, at the Brooklyn navy pard on the morning of May 12th, was usually brilliant function. In its lechnical in its lechnical aspects nsually brilliant function in its lechnical aspects the launch was particularly successful, and wo offer our congratulations to the naval constructors who were directly responsible. The ship is now tied up at the many yard dock, where she will receive her side armor, which is sirendy assembled at the yard, and her turreds which are also about ready for placing

A most interesting feature of the day was a dinner n edebration of the event, given by the empi of the yard who built the ship. This event at which some 1 200 were present, included among the aposters Vice President Sherman, Governor Gibbriat of Florida Assistant Secretary Winthrop of the Bavy, Ad Leutre the commandant of the navy vard Naval Con structor Baxter, and others. (apt Baxter referred to ... acroug personal interest taken by the whole for of men who worked upon the Florida" in the succ of the ship To the Bellior, who was present as guest, the genuise cuthusiasm raised among the m whenever any refer ence was made to the the strong personal interest taken by the whole force of men who worked upon the Florida" in the success

the yard, and ship. its officers seemed to be a atrong indorse ment of the policy of having at all limes a batticship under con-struction at the New York yard

in response to sev erai inquiries as to just how a battleship is launched, we have prepared the accom-panying sketches, showing a portion of the isunching ways mer the bow The "ground' ways con-sist of rows of piling driven to a solid bear ing upon which are spiked heavy, square timbers, or "caps," ilmbers, or "caps, running transversely Upon these are laid series of heavy, longi tudinal square tim-bers in three parallel lines, one immediate neath the keel and one on each stde

of the ship between the keel and the hilges Duriug construction the weight is carried upon the keel blocks and upon hundreds of aboring timbers. When blocks and upon hundress of aboring timbers. When ship is ready for isunching and a few minutes before the actual taunch libe weight of the ship is ready for isunching the chib before the actual taunch libe weight of the ship is rundrered from the central thou thorks and the shoring timbers to the two parallel lines of launching ways. Each permanent way, built up of heavy, sequer timbers, presents a stilling sarriare four twide exceeding the whole length of the ship and permanent ways are fainteed frust down to the cross sequence and pilling below. The issue hing ways which are also four feet in width, are attached to the hull of the ship, and more with it down into the water Dictween the under surface of the permanent ways is a tible? the upper surface of the permanent ways is a thick coaling of grease, oil, and other lubricating aubstances. The launching ways have to be moided to the form of the laint into which they form a crade, and our draw ing shows part of the cradie near the bow, which is known as the forward "poppeta." The poppeta consist of six acts of 14 inch by 14 inch timbers in groups of half a dozen. At their upper ends these groups of nair a dozon At their upper some times timbers bed against heavy angle iron bracksts, and at their lower ends they rest upon what are known as the "trushing timbers" long lines of parallel tim-bers four feet wide the bottom one of which forms the aliding surface of the launching ways. The abovemontioned angle trons are riveted to steel straps from a half inch to three-quariers of an inch thick and 43 inches wide which extend down below the keel and up to aimiliar brackets on the other side of the ship The space between the straps and the hull is filled in

with four inch white pine timbers, which form the with four inta white pure timers, wann form the bod in which the bow of the vessel rests. To assist in tying the whole cradle together, heavy wire ropes has beneath the bow and are carried around heavy oak thimbles, placed on the outside of the poppera. Further support is given by 15g inch tie rods, which are drawn up anugty by nats on the outside of the

The crushing timbers are provided through their entire langth with a series of oak wadnes intertheir entire inagth with a series of oak wedges intor-posed between them and the launching ways below About haif an hour before the launch, hundreds of workmen range themselves up and down the ways, and by means of beavy sledges drive these wedges forcing the launching cradle into clo noun, precing the inducating cradie into closer con-inct with the ship, and avantually lifting it sufficiently to clear it from the keel blocks, thus transfarring the load entirely to the launching ways.

tone entriety to be insumening ways.

This brings us to the consideration of the interest
ing method by which the ship is held in place, and
prevented from starting off down its wail-greated "toboggan" until the exact moment when the christening performed and the order is given to lat go king and starting gear are as follows

ior-ting and starting gear are as follows. The hardwood inunching ways are extanded forward and airongly bolied down to the ground or permanent ways. After the wedges have been driven home, and the ship is resting on the inclined and well-greased auriaces it is prevented from moving solely by these bolted connections. At the criti-cal moment, at the word of command, carpentars armed with cross-cut saws commence to saw through these timbers, and as the cut is made, a point is so reached where the tensional strength of the rema

of appeals understonly support of delay and expense, throws Commissioner the impossible upon an over-butt task of giving to Commissioner the impossible stall of giving to e-case the amount of personal attention preper to disposal, as demanded by law Lastity, the Binter Examinera-li-Dirk, as at present constituted, e-siate of three members, and no provision made under the present inest to supply a tempor vacancy caused by sickness, or other cause, with result that the absence of one other cause, with rults in an unevenly divided Board, and in the o

quent necessity for a rehearing. The absence of the members causes an entire suspension of business.

The enactment of Mr Curriar's bill into a law would an appellate Board, any three meml which would constitute a quorum, the prosecution of all applications on appeal would be expedited, and elimination of one appeal would mean the saving elimination of one appear would mean the saving we the laventors of one appeal fee, attorneys' fees and incidental axyeness. Lastly, one appeal in the Panish Office instead of two would give greater stability the decisions of the office tribunals, and would affect the decisions of the omce tribusta, and would not obvisia any want of agreement that has at times isod in the past between the decisions of the County of th

The largest oil gusher in the history of California. The largest oil gusher in the history of California, and perhaps the most profitable in the world's history, is the Lakeview in the Maricopa oil field, forty miles southeast of Bakevafield, Cal. The gusher spired to spout on Tuesday morning, March 18th, and, war for a period of eight hours in which it banded up' on March 18th, when it hurst forthe of ign own accord like a worland oil, the well flowed continuously up to March 18th, werently as flow or cardinously up to March 18th, everything a flow of cardinously up to March 18th, everything a flow of march 18th, and the state of the second of the second of the property of the prop Sayou narrols of oil of its gravity became each 24 hours, as measured in the run-off from the sump hole through a ditch in which the oil runs to a repidly built pipeline Blance that date the flow has continued at the rate of from 42,000 to 45,000 gallons, and up to May 2rd it had delivered about 2,000,000 barrols

e marvel of the gusher hes b productivity During the two weeks following March 21st, 1910, more than one-helf million barrels of high grade crude petroleum had been collected from the grade crude perrocusin will he acrea the search to the country of the derrick, which, before the crown or top was carried away by the stream of oil, was 16 fort in beigh! The oil sands were surveix at 2300 feet, at which point is treamed on the crude of the country of the cou of feet in the air through the cigni inch chaing Arter the oil sands were struck, the well rapidly "drilled itself" to a greater depth. The well promises to keep spouting for many months to come

The well can be heard roaring for more than a mile. Spray from the gusher has been carried a dis-tance of two and a half miles, and hundreds of autotames of two and a half miles, and hundreds of auto-mobile have curried sighteers from Bakersheld to winsee the unique sight. The same brand for a dis-termined the unique sight. The same brand for a dis-cipation of the same sight of the same sight of the same sight of the same sight of the same brought hy small boys into Marteops. All efforts of the oil flow carried sway the crown or top of the descrike and fifteen feet of its uppermost executive, and the tremendous flow created a hung lake of oil descrike and finding the same sight of the describe and the marted of the same sight of the describe and the marted of the same sight of the describe and the same sight of the same sight of the describe and the same sight of the same sight of the describe and the same sight of the same sight of the describe and the same sight of the same sight of the describe and the same sight of the same sight of the describe and the same sight of the same sight of the describe and the same sight of the same sight of the describe and the same sight of the sam

From a money viewpoint the gusher is said to be the most valuable in the world history, far exceeting the famous Texas gusher in the Beaumont Sel ning the intuities in the Description tests, which caught fire and subsequently ran into sail water, for the owners of the Lakeview had netted by March 21st over \$300,000 from the oil, which is now being piped to tidewater from Maricopa in the San Joseptin valley to Port Harford on the Pacific count, a distance of 150 miles.

of the off from the gusher was in itself no To control the oil from the gusher was in itself no slight achievement. Shortly after the great stream annaed the drillers, three pumps with a combined capacity of 25,000 barrels delty, were started working at top speed, pumping oil ont of the sump-bole, and the oil so recovered was the first oil to enter the huge tanks built by the inde

nis.

The hig wail, which is one of the seven guahers

"brought in" in the Coalings and Midway-Maricope

position of California within the past month, is due

to the porsistency of a sing's man. A discouraged of fields of California within the past month, is due to the porsistency of a single man. A discouraged beard of directors, three days before the gusher was struck, devided to quit drilling. The order was given, but the superintendent conveniently farget it. He drilled 47 feet more against pensity of disminand, and the bit entered the oil mands.

the bit entered the oil made.

"To date all efforts to city the well have proved un-publing, and the oil is now runhing heavenward her.

It is an interesting that the lately the gravity.

It is an interesting that that lately the gravity of the oil has revere from 15° Bearman to 30°. This less bein, tajens to indicate that the oil is now being drawn lately, a force substitute of "one".

WEIGHT DISPOSITION IN APROPLAUSS

To the Editor of the Strutting American
in your issue of April 39th Mr Godfrey assumes
that the center of suspension and center of thrust
are coincide', center of gravity low, and center of
resistance to the lateral motion in verticel rudder

In an aeroplane with perfect stehility the center of gravity should be low, the center of thrust below the supporting plane yet in the center of resistance ed motion and the vertical rudder below the to forward motion and the vertical rudder below the center of suspension yet at the center of resistance to lateral motion. In my monoplane the operator by shifting hie weight elightly can raise the inner wing in making the turn MORES FOATELIN

WEED-OTTING BOATS.
To the Editor of the RESTRICA MERICAN
1 bare been a constant reader of the RESTRICA
AMERICAN FOR, I think more than thirty year—lack
as far I can remember, anyway In the issue which
I received fatterfar, I moticed an illustration of a weed-cutting boat and a description sent by your Paris correspondent. While I do not know that there is a specific statement in the article that it is a new scheme rertainly one can only gain that inference from the

While I do not remember to have seen a weed-cut ng boat exactly similar to that one, they have been in ting boat mas in this country by many of the ice companies for many years. The Consumers' Company of this city, of which I was vice-president end general manager for a good many yeers, something like ten years ago hull a boat at their own works for this purpose and while a none at enter own works for this purpose and while owing to the fact that gasoline engines were not then so universally used as at present steam power was used for its propulsion and for the operation of the used for its propulsion end for the operation of the cutting kulves, yet its purpose was the same and it accomplished the same end and in my judgment was in some respects better than this French device. As I remember it, was merely built a flatboat about ten feet wide and forty feet long. We mounted the wheel at the stern, after the manner of Missiashpil River desembatts, instead of at the bow as in the French boat and we placed the cutting knives a the box They were about the same type as those used on mow They were about the same type as those used on most manifers and were operated by the same engine that propolled the boat. We mere! used a small origin the proposed of the same and the sa

and the other as pilot. It was arranged to cut to a depth, I think, of four feet I know of several boats of this same theracter used by various lee companies and I think in one respect they are very much botter than the French boat as they are very much better then the French beat as the cutting knives are in from, and the plick knows just what he is doing all the time and of course, he can run the beat very much nearer the shore was called the second of the time and cut the weeds out in very much shallower saler. The ranker, beat runs over the tops of the runshes, pushing them down possibly so that the weed cutting knives would not cut them at all Chicago, ill John Williams.

Bouth of Prof. Auguro

The well-known Swelish objected, Dr. Knut Ang strom, is dead. To the general public his passing will mean little, because he investigations were not or the character that attracted public attention. To the celement his death means and loss for is him physics has been deprived of one of its ablest investigations. Prof. Angartom was the second generation of a family distinguished for its aelectific researches. His father, John, achieved fame by reason of his splended father, John, achieved fame by reason of his splended born in 1807. He attacked at the University of Upsale, where he afterwed taught. Ill occupied a professorial chair at the time of his death. Angartom's fart pessearches were made in the field

earches were made in the field Angarrons and researched were made in the note of apoctracety. By means of the spectroblometer he studied the phenomena of absorption in the infra ed spectrum, notably for carbon monoxide, carbon dioxide, varies and cases. These investigations gave rides to an interesting controversy with Arrhenius. Water vapor, carbon dioxide and occore have ning. Water vapor, carbon cloking and come have a marked influence on the interpretation of our globe In effect, they partially hamper the radiation of the earth into inter-stellar space and thus aid in main taking the surface of our planet at a temperature compatible with the conditions of life with these fights up a basis, Arrhenius built up as ingenious

theory to account for the glecial period He supposed that the quantity of carbon dioxide contained in our atmosphere has increased since that period Ang etrom proved that Arrhenius' reasoning was veild only for carbon dioxide of almost infinite tenuity and that the possible variations of the tennity of carbon diexide in the air could not possibly have hed eny influence on the temperature of the earth

on the temperature of the earn
Angstron's name will be forever linked with the
study of soler radiation An instrument which he is
votted for the purpose of measuring this radiation
and known as the Angstrom pyrheliometer is now
widely used in observatories

THE MANUFACTURE OF TWINE

BY DAY ALLEN WILLEY

What is generally known as hemp twine, used in such enormous quantities for various purposes, is manufactured from two varieties of ther known as Manile and Sissi Needless to say the first named comes from the Philippine Islands forming one of the principal products of this possession of the United Shates while the Shate of Yustan contributing the larg manufactured can be gained when it is stated that such wear no less than 125,000 tons are shinned from e city of Manila ment of it coming to the United States

The Aber from the Pkilippines is obtained from a

varted into fiber. This is done by the usual method of decortication. The material is fed into the receiving hoppors of the mill by means of an endless con-veyer, the leaves being hild upon the surface of the conveyer aide by side By means of toothed wheels they are cut lengthwise into shreds. In this state the they are cut lengthwise into shreas. In unis state the material is passed through mechanical cleantry which remove all of the pulp. Next the fiber passes out of the decorticator and is carried to yards adjacent to the mill; where it is hung upon itnes end dried by exposure to the heat of the sun. This process con ed, it is pressed into bales of conveni is then ready for abinment to the United States. airendy stated, the preparation of Manila fiber is done

almost entirely by hand, and before being export ed it is also dried in the snn, the long poles, how ever, instead of rope or wire as at the Moxican

species of the banapa family, which attains a height of fifteen or twenty feet. The stems of the separate leaves grow in a close cluster form leaves grow in a close cluster form ing what appears to be a solid tree trunk, to the height of ten or twelve feet, where they suparate and hranch out like the limbs of an ordinary

Type of spindles used for convarting

The natives cut these stalks off near the ground removing the leaves from the top of the stalk, leaves from the top of the stalk, then expanding the stum and removing the rule from the filter by repeatedly draw high it arrows the edge of a dull liked pressed on the fact of the stalk of wood. This primitive has not a yet given likes to modern meaning the notal stalk of the
fined to the mountainous districts. After the fiber has been dried it is packed in convenient sized bun dies and brought down to the coast villages where it is purchased by exporters, who sort the fiber and press it by machinery into bales convenient for ship-ping. These bales are protected by mattings works. r plaited from rushes by the natives, and ere secured by ratten bands

by ration bands
The Hencequen plant furnishes the Sisal Sher which
le brought to this country The plant bears a re
markable resemblance to the well-known century
plant and is frequently mistaken for the latter on plant and is frequently mistaken for the latter on account of its appearance. As it forms one of the principal products of Yucatan the Sizal plant is cul-tivated on large plantations, principally by Indian labor. The young plants on these plantations are set out in rows about ten feet apart. About the 5fth or out in rows about ten reet apart. About the min or sixth year the plant is smill ently matured, so that the under and larger feares are cut, and the pulp re-moved by decortication, leaving the fibers to dry in the sun, they are then bailed ready for market. The plant continues to grow and produces about a dozen mature leaves each war At the end of a period ranging from fifteen to twenty years the plant dies, and is replaced by a young one
The method of gathering the Sissi and shipping it

ine mentou or gathering lies Ness and shipping it to market is much wore setematic than the process employed in the Phillippines, for nearly sti of the Sleat plantations have transveys extending through the Henequen fields, so that so fast as this curious hervest is gathered it can be loaded directly on can and drawn by mnles to the factory, where it is con-

twine of commerce is performed by practically the same process The interior of the modern twine factory is somewhat similer in appearance to that of a cotton mill, with the exception that some of the machinery ntilized in the let is due to the fact

that less care is required in the preparation of the fiber for spinning, required in the preparation of the fiber for spinning, asince its appearance usually does not increase in the value of the finished product. As is well known, the value of the finished product. As is well known, the most elaborate apparatus installed it includes the most elaborate apparatus installed it includes the opining and excitating machina, by which the material is cleaned from dirt and other foreign particles. As the fiber is not a mass of that like raw cotton, this mechanism is not required, nor is it necessary to form it into both preparatory to carriegg in the modern (wite mill, however, the fiber is passed through mechanism which is somewhat ariginate to the carding of the conting of the continuous (whe mill, however, the fiber is passed through mech-enium which is somewhat similar to the carding en-gins and performs the same duties, disentanging the fiber by means of revolving cylinders provided with cards which are suitable for treating such coarse ma-terial. When carded the fiber is drawn into a condnit, through which it passes between calender reli-ers and emerges from the machine in a course strand. It is then coiled in large heaps either upon

movable racks or the floor. This is the first process in preparing the hemp—for such it has now be-come—for spinning, but before being conveyed to In preparing was some, we said it has now so-com—for spinning, but before being conveyed to com—for spinning, but before being conveyed to finishing meetine. This combines in part the draw ing and subhing frames of the cotton mill, so that when the material emerges from it, the strand has-been considerably reduced in size and is eligibily twisted, enabling it to be coited in cans, from which it is fed to the spinning framine while the which it is fed to the spinning framine while the which it is fed to the spinning framine while the this fiber especially, it is an amountle in it comes from as than modern self-exciling mechanism, and go more human labor is required to convert the silved per modern self-exciling mechanism includes of many factors of yars and thread from the ordinary cotton. The twins spinning meachine included drawing rolls from them being invited by the action of its spitching from them being invited by the action of its spitching from them being invited by the action of the spitching from them being invited by the action of the spitching from them being related to the contraction of the spitching from them being invited by the action of the spitching from them being invited by the action of the spitching and the contraction of the drawing rolls.

the movement of the drawing rolls.

As fast as the twins is span it is sise wound on a large speel or bobbin the latter being taken to the bailing machine as soon as it is filled with the twiner The bailing machines are sise automatic in their operation, not only winding the bail from the bobbing operation, not only winding the bail from the bobbing but discharging the finished belli automaticity whose it has reached the proper dimensions. Those ma-chines are salculated to wind bails weighing five pounds each where the twine is need in connection with binders and other agricultured machinery, the balls being parked into cases holding ten rach

At the McCormick plant, which is illustrated in the accompanying engravings, several grades of hemp twine are produced, one of which includes the mix ture of Mexican and Manila fiber, as this is found to be very durable. To show the difference in the weight of the material it may be said that a pound weight of the material 11 may be said that a pound of such twine contains 800 feet. The twin- made on tirely from Manila is slightly finer and averages 640 feet to the pound, while the Sisal is the coarsest, averaging 600 feet to the pound.

Educating the Permen by Rel1.

27 if 4 coarter.

California sees a way to solve the food problem by educating the farmers.

Sha believes that the farmer is never too old to

Bales of twine ready for shipment

THE MANUFACTURE OF TWINE.

She siso believes in teaching the young to be farm-

Accordingly, the State maintains a college of agri-culture, a university farm, polytechnic achool, United States experiment stations, etc. 5

states experiment stations, etc. 1.

Now sha proposes to introduce the study of agriculture into the public schools of the State.

A embatantial beginning in this time has already been made in the catablishment of the study in the

high schools, later on it will find a place in the

nign scroots, later on I' will find a place in the primary and grammar schools.

Then California has its farmers' club, grampes, and farmen' nulosa scattered all over the State, and these organizations exercise a large influence upon the edu-cational thought of the day

cational thought of the day Every year some hundred or no barm insellmen are hald in various parts of the State and reach annually between 20,000 and 35,000 farrance. California has the best originated horizontaged some

mission in the world, comprising a central office and State insectary at Sacramento and a quarantine de-partment in San Francisco.

ariment in Ean Francisco.

Each county covering a horticultural section also has amoin county covering a horticultural section also has its own local commission, inspectors, etc, while the fruit growers hold two State conventions annually These all wield a strong educational influence and add largely to the sum of farm knowledge in the State

But the latest and most striking feature of Cali fornia's campaign of farm propagands is the so-called "Agricultural and Horticultural Demonstration Train."

This train is the joint work of the California College of Agriculture and the Sonthern Pacific Company, the one amplying the exhibits and corps of lecturers and

This led to the organization of the "Agricultural and orticultural Demonstration Train" Horticultural Demi

And it only needs a glance at California's industrial statistics to convince one of the truth of this charge

of wasterul husbandry.

California thirty years ago was one of the leading
wheat-producing States of the Union in the year
1879 its wheat output amounted to not less than 1707,800 tons, in 1804 the annual product of wheat had
dwindled to 465,028 tons, a ahrinkage of more than

seventy five per cent. California was forme orly a great exporter of wheat California was formerly a great exporter of wheat and flour. In the year 1882 she exported not less than 1,138,031 tons of wheat and 919,598 barrels of flour. In 1904 her exports of wheat had dwindled to 54 381

of wheat snnually in order to keep her mills running, and And all a result of poor

of weat and dwindled to be say tons and flour exports to 882 485 barrels. To-day both the ex-port of wheat and flour are nil and the State is compelled to import a million dollars' worth her flour up to standard grade

farming, as is ovidenced by the fail of the avorage annusl yield per acre of wheat from forty to less than fifteen

portance of restoring the lost fertility of depleted soils portance of restoring the lost ferility of depleted soits and the maintenance in their composition of that vital element known to agricultural sciences as hu mus, all of which has a direct bearing upon the increase in the production of food-staffs sufficient to supply the demands of a constently increasing population

Pire Control in the National Porcets

Probably one of the best things in the line of an agreement has just been signed by the Secretary of Agriculture and several railroads whose lines run alongside of the national forests. Two of the largest and longest roads in the Northwest (the Great North ern and the Northern Pacific) have right of way through some of the richest timber districts in the

ern and the Northara Pacific) have right of way through some of the richest imber districts in the West and this agreement is of grest benefit. They have in view both the reduction to the lowest point of fire risk from the operation of the railroads and joint action by the Fornest Service and the rail roads to fight all free which may start along the roads to fight all fires which may start along the lines Both companies have agreed to clear and keep clear of inflammable material a strip of varying width, as conditions demand, up to 200 feet beyond the right of way, and to provide all locomotives which do not hurn oil, with snitable spark stresters and other

standard equipment to prevent the drop-ping of fire An effort will also be made by the companies to so operate their en gines as not to cause fires.

gines as not to cause fires.

In fighting fires the railroads and the Forest Service will co-operate closely Noti fication will be made promptly to the Forest officers of all fires discovered by employees of the railroads Telephone employees of the railroads Telephone wires to make this possible will be put up

demonstrators, and the other a fully equipped railroad train comprising three exhibit cars, a lecture car, a sleeping car and diner, all absolutely free of cost to

The work of the train is arranged in a series of annual tours, covering all the leading agricultural and horticultural sec-

Each series consists of five septours, each tour covering from 500 to 1,000 Uses
mlies, and from twenty to twenty five stopping places. The work of the train begins in the late fall and ends in the late spring It does not specialize like the demonstration train of the Bast but covers all

the leading lines of agriculture and horticulture
Its corps of lecturers contains some of the ablest
members of the faculty of the College of Agriculture, and the president of the university, Benjamin Ide Wheeler, frequently joins the train in its course, and

ment The Southern Pacific Company very candidly admits its own interested motives in the premises, and frankly explains that it discovered a serious failing off in its local tonnage, and when the matter was in vestigated it was discovered that the shrinkage was found in the item of farm produce

They consulted their local freight agents as to the underlying causes, and were told that the principal cause was an exhaustion of the soil This was hardly believable, and the company con

This was hardly believable, and the company con-suited the soil experts of the College of Agriculture who denied the theory of exhaustion, but explained that the soil had been depleted by a practice of poor cultural methods.

Combing out the hemp preparatory to shipmen

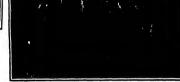

It is this era of wasteful farming that California desires to put a stop to, and hence in augurates her campaign of agri cultural education

The "Agricultural and Horti-

The "Agricultural use notes that the continual Demonstration Train" is developing unlooked-for efficacy it was originally intended of for the enlightenment of the present generation of framers, but its inducate is being carried beyond that limit, it is being brought to have more the states generations and the young folks using carried beyond that limit, it is being brought to bear upon the rising generations, and the young folks are fully as much in evidence at the lectures and dem-onstrations as the bider ones.

DAMMING THE MISSISSIPPI

BY W. P. GREEN

Excelled only by the monator dam arous the black of Nile River, the greaters equiparting for it is the barieful River, the greaters equiparting for it is the barieful River, the greaters equipartial River was the Mississippi at Rockells from the point from which Colloses wit started the river journey to the far was exversal years got A huge dam to being hittle access the Mississippi at the foot of the rapids with the the north of Kechnik, and the stored energy of the river is to be used in ga acrating over 200 and sterile alternative will be distributed throughout the Middle West, the first long distributed throughout the running to 81 Lonis 170 mississiphility to be developed in one winder contract. The bed of the river at this point affords an excellent rock foundation for dam will be built of referred concrete, and over 160,000 larreds of eccuent, and 7,000 tons of steel will be required to the construction of this against

The dam, including abutments, will be 4 700 feet

of 43 feet. On top of the apillway will be placed 118 steel flood gates, 30 feet wide and 11 feet high, supported by concrete piers. The piers are to be built integral with the dam, being cerried down to bedrock on the upstream side Thay will support any another higher, from which the gates will be operated by electric beings. Through the manipulation of these gains the water above the dam will be maintained at a constant local and all seasons.

Four fifths of the dam, the 4,600-foot section, will ketted in a straight line scross the river, breasting the current of the broad river. The balance of the am will be built appreximately parallel to the abores and at right angles to the math dam. This portion, 100 feet long 121 feet wide and 123 feet high, will be excussed by the power house. The substructure, so the property of the property o

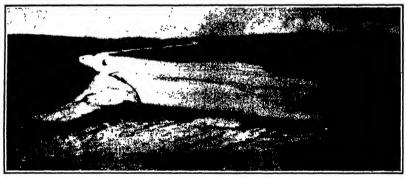

the power house, will be the revolving parts of the generators.

generators. To keep fonting ice and logs from antering the power house, an ice fender will be built upstream from the upper sed of the power house, curring in toward the shore. This will be 2,800 feet long and

built of concrete manoary.

The construction of the dam will entirely destroy
the government canal, built to carry shipping around
the rapids. This canal pay consists of three locks.
In its place a single large lock will be built. There
will thus be substituted for the canal is lake of deep
water over a mile wide at the dam, and of mike long.
The government has given permission to built die dam,
and it price for all ind ownflowed as the result of the
cregition of the reservoir.

a fair price for all land overflowed as the result of the creation of the reservoir. The construction of this gigantic river project is under the direction of Hugh L Cooper of New York city. The work of excavation is well under way on

This hape structure, over a mile in length. Is being built across the Mississippl at Kockuk, lows. The dam, which is broadly similar to the Associan dam across the River Nile, is provided with 160 food gates to control the height of the faced. A late 40 miles long will be formed and bifunately EQUID electric horse-power will be prevented in the power house shown at the laft of the dam.

THE WINGE DAW WINGE IS BRING BUILT ACROSS THE WISSISSIPPI

iong, or seven-eighths of a mile. The spillway acciton will be 4,400 feet in length. The dam will rise 37 feet above the river bed, and the base has a width

power generating units each consisting of a vertical steel shaft, carrying on the lower part two turbines, or water wheels On the upper part, on the floor of the Illinois side of the river, the project will be pushed as fast as the material is delivered at the site

The Commographic Museum of Monnes,

The Oceanographic Misseum of Monzo was form ally opened on stack 38th, 18(1), this founder, Prince Albert I of Monzo, in the presence of representative of various foreign government. The celebration is indeed a pyrotechnic exhibition and an alticurrical augustant in the beautiful lay of Monzo, a gial augusta in the beautiful lay of Monzo on a gial and the restriction. The men museum, which is also a indoprator, is connected with the Oceanographic Institute of Paris and both institutions, with an audorement of four million fraints that the company of the control of the million fraints and fraints and fraints are control to the control of the definition of the administrative council of the Institute, which in cludes among its members of President Loubet and the physicistic distlete and Beyenevel The direction of the estentific work is confided to an intronational committee for it was Prince Albert's design to form an institute and a infortation in which is the concept of the Institute were inaugurated in 1905, at the Concept of the Institute were inaugurated in 1905, at the Concept of the Air of the Concept of the Seaton of the Seato

The Occasiographic Museum of Monaco, which has already received the popular name of the Paince of the Sas, is built on the flank of a steep cliff at the edge of the sea. On the water side the huilding is 256 feet high, while the haight of the main façade on the land side, is 148 feet, the difference being due to the

stope of the citi The length of the huilding, parallel to the water front, is 10 feet. The cond of construction acceeded \$1,500,000. There are only four atorises and the rooms are very high, large, and we'll light the two lower stories which are partly underground, contain the squartime and shorsoriers, while the upper stories are devoted to the subbillion of sounding and other apparatus, and of the rich and varied collections of deepees faune and flore which represent the result of a quarter crutury of exploration Prize Albert has also placed a small steamer, the "Eiden" at the disposal of the Museum

a the disposal time in interests. The Prince of Monaco has made a scientific crules is the Mediterroad. Allanti or Arctic Ocean. The experience acquired with the "Hitmodelle," a sattling grached 200 tones, and afterward with the "Princesse Alice I," an ansitiary to good use in the construction and equipment of the "Princesse Alice I," an ansitiary to good use in the construction and equipment of the "Princesse Alice I," an ansitiary to good use in the construction and equipment of the "Princesse Alice I," and any the base of the princesses and the princesses of the princesses of faunt, form, and, mud etc., at very great dispitus. A great part of this apparatus was invested and constructed by the Prince and his assistantic.

This cases of the Manasum contain proposentatives.

The cases of the Museum contain representatives of all known deep-set fanns. Many of these specmens are interesting even to the non-scientific observer because of their strange forms, beautiful colors, and peculiar organs of sight and touch.

and peculiar organa or sight and touch.

These occanographic explorations and collections
also possess great practical value, in addition to their
scientific interest. Most edible fishes feed upon the

piankton or mass of small animal organisms which are waited hither and thither by even feebla ocean currents.

The explorations have proved that the plankton moves in a manner dapendent on the season and tocality. These migrations appear to be governed by complex laws, the knowledge of which, as it is grad usliy devaloped, will be of great value to the fisheries, especially to the steam fisheries, as the fish follow the plankton

MAY DE TOTO

To prevent the destructive hammaring of the rails when depressed by the passage of a train, a new con-affection has recently been designed to furnish a more stantial support at the rail joints for them

IMPROVED BAIL CONSECTION.

creates in providing timbers or the running longi-tudinatily under the exitia at the joints. In addition to this, a number of very substantial mealitic flatest-ings sever to clamp the rails inhighly in position in usually the case that the joints of a railroad are arranged to come between and hot on the ties and heavy flabplates are depended upon to support them. The construction here liturated is intended to them. The construction here liturated is intended to them. The construction here liturated is intended to points. As shown in the accompanying ourse, any depressed, and on them is laid the longitudinal timber B. The last is clumped down to the litural by moran of a metal fratening C, which is aboven in full in Fig. 2 This is substantially of form, and may be remade 3-modity piece. It is preferably monthed has to remain the construction of the construction of the terms of a metal fratening C, which is aboven in full remains a secure of the construction of the construction of the flat points. The construction of the construction of the remains and the construction of the construction of the remains and the construction of the construction of the remains and the construction of the construction of the construction of the remains and the construction of the construction of the construction of the remains and the construction of the construction of the construction of the remains and the construction of the construction consists in providing timbers or ties running long integes are secured to the time by metha of spines in the control of the control and also increase the safety of the railroad ventor is Mr Henry Grass of Alvin Texas.

PRECE POST ANCHOR

A patent has recently been granted on a noval method of supporting a tence post, so that it will with stand excessive strain. The construction will be especially useful for anchoring corner posts. The device i tached to any post in our lituatration, we show in Fig 1 the construction applied to the ordinary fence

post, while in Fig. 2 is shown the construction need for corner posts. In both illustrations the post is designated by the letter A. At the bottom of the post is an anchor plate 2, which at one end is fastened out to form a blade of The opposite and of the anchor plate is doubled upon itself to receive the lower ced of a diagnosi larce 2, the upper end of which is botted to the post. An angie brace 2 is secured to the opposite side of the post and connects it to the anchor plate B The spikes which pass through the anchor plate are long enough to be driven to a conancory pasts are long enough to be driven to a con-siderable depth in the ground, and serve as additional means for prevanting the anchor plate from sliding out of position In use a trench is dug at the point where the post is to be erected. The trench is just wide enough to receive the anchor plate B, and the hisas O of the plate is driven into the undisturbed ground at the end of the trench, thus affording a firm suchorage. the end of the trench, thus affording a firm anchorage.

Thereaftr the post is erected on the anchor plate and
the braces D and E are bolted fast. For corner posts,
the anchoring device to used in duplicate. The blades
C of the anchor plate are driven into the ground at the or plate are driven into the ground at the side, where there will be a lifting strain imposed by the tension of the fance wires. The inventor of this anchoring device for fence posts is Mr Julius Laux, of

AMMONIA PURIFIER FOR REPRIGERATING PLANTS. AMROSTA FURIFIER FOR ENTRIPERATING FLATTS.
A recent patent discloses an improved method of purifying ammonia, so as to render it ashydrous in rerigerating plants. The object is to produce a high grads of anhydrous ammonia continuously while the compressor is in operation Au apparatus is provided which is connected in circ uit with the compressor and condenser and removes a portion of the heat from the compressed ammonia so as to condense the oil and water vapor and permit dry or partially cooled hnt uncondensed ammonia to be delivered to the con-densing coil. In this way the amount of couling that

APPARATUS FOR PURIFYING AMMONIA YOU

is required in the condenser is reduced. The passage of oll to the condenser by revetted sud the ammonia is condensed superated, so that only pure anhydrough ammonia is delivered to the expansion vaity. The apparatus comprises two bolders or drawn A and B within are consected at the bottom by a pipe C. The drawn B is preferably raised above the drawn A the compressed ammonia enters the drawn A, through a superated propersion of the drawn A, through a superated propersion of the drawn A, through a rompressed ammonia energy ine grain a, tarvogs a pipe D then passes through one or more connecting pipes E to the drum E after which it passes out through the pipe F The cooling system consists in a pair of water chambers O and a pipe H, connecting the top of the water chamber in drum R with the bottom of the chamber in the drum A. The water passes through the cooling system in the reverse direction to through the cooling system in the reverse direction to the flow of ammonia through the apparatus. The iemperature and rate of flow are so controlled that there will be no condensation of ammonia in the gas holders, but all the oil and water vapor which may be carried along with the ammonia will be condensed. be carried along with the ammonia will be condensed in these holders and sercumulate in the lower portions. If the valve in the pipe O is opened, the oil and water will flow lint be bottom of the drum A and may be drawn off at that point. The object of letting the pipe from the compressor pass up through the oil and water in the drum A is to best the oil and thus pre-went as far as possible the loss of ammonia. The investor of this apparatus is Mr Lawrance Wagner of Missouri Avenes and Missouri Pacific Tracks. edalia Missouri

CONVERTIBLE BOAT AND TENT.

OSSYMMINES BOAT AND TRNT,

Por the benefit of campers, hunters, and the like, a
folding tent has recently been devised which may be
packed late a very small compass and which may also
be montered into a canvas boat. Our illustration
afficing the device in its two forms, partly broken away.

to reveal the framework. It will be observed that the upper portion of the tent comprises a pair of lasy toggs 4, consected by rowes hers B. Howe are supported on four posts indicated at C and D, and the structure is resolved with the property of the structure is resolved up to reside the means of a system of guy wires. Swung from the framework are a pair of bers E which support a hammock P. The upper portion of the tent frame is covered with water proof canvas, and in addition to this, there is a lower canvas section which may be fastened to the upper section by means of huttons, thus forming a sparlous tent, and the occupant can sleep on the hammock,

CONVERTIBLE BOAT AND TENT

while h is a decided improvement over unless the group with he a decided improvement over using the ground of a bed. When bracking even the posts of and D are withdrawn from their socket a not the lary longs are folded up, so that the entire framework of the tent may be placed in a small bag. To convert this framework into a boat it is extended and interied, so that the cross bars B form the bottom of the boat The large M of the humano k are, hooked to the frame-The hors E of the hammock are hooked to the framework at one end and fastened together at their outer cults to form a bossprit for the boat. The bossprit is braced by a pair of arms H which are hinsed to the cross but G It will be observed that the lary tongs cross for G. It will be observed that the fary tongs at J are cittaded to from carlocks and the posts C of the test are so constructed as to form care. The seat the test are so constructed as to form care. The seat seems A. The results of the test at a rangisted to the framework including it and thus forming a find both control care to the
INDEX SYSTEM FOR POCKET MEMORANDA
A patent has recently been grunted on an improved
pocket memorandum book, which is provided with a
movel indexing system. The first leaf of the book is shorter than the others and serves as a topic list, being ruled to allow of entering various topics on which notes are to be kept. The other leaves of the while notice are to be kept. The other leaves of the book ser cut with series of table as shown in the illustration the table on each leaf corresponding in number to the topics provided for in the topic link. When notice on a subject are entered on one of the 1 aves of the book, all the taim of this leaf except that opposite
the topic to which the notes relate are cut eway When a leaf is filled, it may be removed and filed away in a card index—it it is desired to permit the leaf to remain in the memorandum book after it has been completely filled the tab is partially out away s it will still serve to locate the feat but will not inter If will still serve to locate the leaf but will not finite fere with the thumb in resulty finding the next intundements in the same series. In this way the entire memandum book is so arranged that its matter it contains is always properly indexed, and may readily be reterred to whenever desired bur thermore the material is so placed and the leave-age so arranged that when they are removed and died

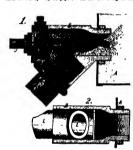

HERMANNE BOOK WITH BOYEL INDEX STATEM

Scientific American

an a card index no transcribing of the notes is neces mary The device should be of particular advantage to the modern farmer, horticulturist, gardener, or stock man, who must have some convenient way of collating and preserving the data of his daily work if he is to got a full measure of profit and satisfi tion out of his experience from year to year He cannot afford to trial his numbry with much impor-tant detail, and an claborate system of keeping a record dots not appeal to him. The pocket memo-randum book with topical index should meet his needs. The investor of this memorandum book is Mr. B. A. Bagby 1107 Brook Street, Louisville, Ky

IMPROVED TRACE SANDER.

l'icipred in the accompanying engraving is an im-proved track sander for use with locomotives. The apparatus is so arranged that two jets of compressed air are employed one of which is directed against the o sand box, serving to agitate it, while sand in the sand box, serving to agistat is, while the soluter arts to disharage the same confineously and smoothly Spe lat precautions are taken to prevent the nozzier from leving cinged with sand in our illustration line sand box is indicated at A. The sander canning of its auditantially of Y form it is threated into the sand box and hold in piace with a color half Alt the opposite and of the examine is a ping C, provided with an extension D constituting the provided with an extension D constituting the provided with an extension D constituting the contract of the examine is a ping to the provided with an extension D constituting the contract of the examine is a ping to the provided with an extension D constituting the contract of the examine is a ping to the provided with an extension D constituting the contract of the examine is a ping to the provided with an extension D constituting the contract of the examine is a ping to the provided with an extension D constituting the provided with an extension of the examine is a ping to the provided with an extension of the examine is a ping to the provided with an extension of the examine is a ping to the provided with an extension of the examine is a ping to the provided with an extension of the examine is a ping to the provided with an extension of the examine is a ping to the provided with an extension of the provided with an extension of the examine is a ping to the provided with an extension of the examine is a ping to the provided with an extension of the prov the horr is constricted to form a let opening, which communicates with a recess in which a hall P is placed in addition to this, there is an inclined jet pure u in addition to this, there is an inclined jet opening E. At the opposite end of the ping there is a sercen H which serves to strain the compressed air that enters by way of pipe J. In the other leg of the

IMPROVED TRACK SANDER.

Y-shaped easing is the pipe L, which leads to the point at which it is desired to discharge the sand Within the casing, and extending partially over the passage leading to pipe L is a shelf K in operation, when compressed air is admitted to the nexale tt forces
its way past the ball F into the sand of the sand box

A pertion of the air is directed backward to the jet opening E, producing a partial vacuum, which causes the sand that is agliated by the other jet of air to flow along the shelf L and thence be carried air to flow along the abert A and thenev oc carried down its discharge sipe. I the ball F prevents the constricted opening in the nozzie from being clogged with sand, and this constricted opening serves to reduce the little pressure by permitting its expansion past the ball F, so that a destructive sand hisst is avoided thereby. The inventor of this improved track sander is Mr John Henry Watters of Augusta, Ga

BRIEF NOTES ABOUT NEW INVENTIONS.

The singing sign which has been recently placed in front of a Denver business bouse is a visual as well as sudible means of altracting the attention of passers by The particular sign referred to displays passers by The particular sign referred to displays the word Dimilets' and is of the electric flashing type The illumination of one letter follows the other, and as the lamps comprising each letter are finahed, a wooden hammer sirikes one of a group of orchestral There is a different bell for each letter, and mes represent a complete octave. The comohimes the chimes represent a complete octave. The com-bination of sounds may be varied at will with but lit-

The illuminated elevator threshold is a new to prevont what is a quite common form of elevator secident. The elevator attendant, making hundreds of sions in the course of a day, is not always enabled to bring the car to a hait at the exact floor level, and a very slight variation is sufficient to give the passen ger a joit if not more serious injury. The floor of the car being held an inch or two above that of the building is likely to trip the unguarded person about to enter the car, while persons stepping out are liable to be thrown down. The latest method of avoiding this is the insertion of a pair of plate glass lenses in the metal of the threshold, with an incandescent lamp under each. These are kept in operation all the time the car is in use. The lamps are supplied through the slevator cable in the same manner as the overthe sievator cable in the same manner as the over-head immps. This device has been tried with eminent success in some moving-picture establishments, where the rear seats are slightly above the level of the alsie

floor

The jobhing carpenter moving around from one place to another, and locating for a five days at a wife in a continuous continu been made, so that they may be readily packed up and carried from place to place. The legs fold over on the back of the trestle when not in use and when being transported, and in this form they are very compact. Being of angle iron, the treatle is not heavy and is almost everlasting

ODDITIES IN INVESTIONS.

HAT FASTYKER.—The recent agitation against long hatpins has set a Yankee inventor to thinking. He anapular lines see a statege treatment to minimage rate has arranged a hatpin which has no exposed point and which does not have to be removed from the hat, but which may be operated to engage the hair by giving it a haif turn. The hatpin extends from side to side of the crown of the hat, and is provided

A WOVEL TYPE OF HATPIE

with a series of books or grapples sharply pointed at whith a series of notes for grappies sharply pointed at the ends, so that when the pin is turned they will hook into the hair. Whether the hat fastener has been tried in actual practice we do not know but it seems as if thore would be considerable danger of entangling the hair in the curred hooks.

entanging the hair in the curred hooks Device you beaving on an Envision Organica. An inventor does not have to go far afield for object upon which to exercise his inventior faculties Breen in the most commonquae matters of everyday life there is room for improvement. Take, for insuch these is room for improvement of the property of the control of removing one's overchose the usual way to be the control of the other foot is most awkward, to say the show off the other foot is most awkward, to say

DEVICE FOR DRAWING ON AND REMOVING

the issat Recently, an inventor has devised a little attachment for the cana or umbrella, whereby one can atand firmly on one foot and steady limself with the umbrella while rumering the overshoe by pressing the lug at the back of the overshoe against the attachment on the umbrella. The inventor has previded a

more sinborate sevice to hold the overshee in place while directing it on. The lug at the heal of the owner hose is so formed that it can be engaged between a pair of jaw clamps, one of which is fixed while the cause, and the control of the case is a root, and running from the merable jaw to within a convenient distance of the head of the case is a rod, which may be lifted to release the jaws. Luximous Guy Sturims—When using a gum in the dark of deep twillight, it is very difficult to secure accurate aim, because the sights are invisible This difficulty has frequently been superienced by sentries,

LUMINOUS SIGNES FOR TWILIGHT SHOOTING.

who should be this to cover an approaching enemy with accuracy, in order to secure their own safety as well as that of the camp To enabla this to be as well as that of the camp To enable this to be done, an inventor has recently evisited a gun in which the sights are luminous This is effected by measu of a pair of small olectric lamps lighted by batteries placed in the stock of the gun The sectional views in the accompanity gun of above hos hamps are ar-ranged. The sights are formed with prima, which at their lower ends communicate with chambers in which the lamps are located. The lamps are lit only when the trigger is partially pressed, so that it is not necessary for the sentry to expose his where-abouts until he is ready to fire. The sights are of such a nature that they may be used in the daytima with the lamps disconnected, a switch being provided

for opening or closing the lamp circuit
Support for Electrically Heaten Flatirons Surpose ros kircrascatx Harros Patinosa.—An opera support has recently been invented for electrically heated flatfrons It is so arranged that the current is turned on only when the iron is on the support. The support constats of a metallic base provided with legs of insanisting material and supor which is mounted, in inclined position, a plate of siate On this ten factors in adopted to be supported, so that the head of the flatfron is adopted to be supported, so that the head of the flatfron will alled down and bear against block of inceiting material at the crassing of the control of

THE ACCIDENT TO THE "REPPRLIES."

(Concluded from page 416)

Zennella IV "did not involve the loss of any life The "Republique" catastrophe, however, was tragic On September 25th, 1909, the craft dropped from a help about 200 meters to the earth, and it passengers, Capt. Marchal, Lieut Chauve nd ite and the mechanicians, Vincennot an Reau, were killed immediately. Th

Reau, were killed immediately The disaster was occasioned by the breaking of a propeller blade which flew off the shaft and plerced the gas bag The "Sepplein II," whose untimely end has been described, was taken over by the army last year, and made a member of the German strably fleet. The vessel army fast year, and made a member of the German sirably flost. The vessel took part in fast years sirably mane-vers at Cologne where it was stationed in the spring of 1909 the vessel made a long journey from Lake Constance to Bitterfeld and return remaining unin collided with a pear tree at Goeppingen, and was partially damaged The "Zep-pelin II" had a volume of 15,000 cubic pelin II" nan a votume or to, overcume meters its length was 136 meters, and maximum diameter 13 meters. Its maximum absointe veiocity was 12½ meters a second, or 28 miles an hour its carrying capacity, including passengers. carrying capacity, including passengers and aupplies, was 8800 pounds it was provided with two cars. The two motors of the airubje developed each 115 horse-power The total weight of the V-Zoppeln's was about 23,00 pounds. The batioon frame, rigging and keef, bail toon fabric, as bags, stabilizing planes and matern, weighted 12,000 pounds The countries, see cities weighted about 2,000 pounds.

fire Centrel in the National For (Concluded from page 421) way during the fire season, whi

on way during the nre season, while the work of clearing the strips in a satisfac-tory manner, including the disposition of all refuse, is to be done by the rail-roads but under the supervision of the Forest Service

One of the most potent reasons this agreement is a good one is the fact that the courts have decided the right of the Department of Agriculture to collect damages from roads running through National Forests for fires which they cause, and this fact is a strong inducement for the roads to join with the departm in the effort to keep fires down

Another strong factor is the fact that the Northern Pacific, being a land grand road, owns considerable timber on the si ctions along its line The Great Northern, aithough it is not a jand-grant

Northern, aithough it is not a land-grant croed, also has properly at stake in lis buildings and the tine itself whose operation may be seriously interfered with hy forest confingrations. The value of beary timbs t in mountain our regions as a deterrent to avalanches, and anadatides, and fooder is also to be con addered. From the standpoint of far-sighted business policy a still throader argument is the relations of the forests to the general welfare of the regions whose traffic the reads handte. Timber which goes up in smoke pays no freight tolls and unchecked forest devastation means the enfeeblement of many industries de dent on wood and water

Sterlitation by Wrans of Eltra-Violet Mays. ems to be little doubt are

ing to The Lancet, that the germicids ction of the uitra-violet rays will shortly be made available for the purpos practical sterilization in what in what exact practical sterilization in what exact way the ultra violet rays act is not ore tain, but one view is that they prefere oxone. Whatever the nature of the at tion may be, it seems circar that their application for the purpose of sterilizing articles intended for human consumption will aliminate the objection to the use is very transparent to ultra-violet rats
milk however is practically opaque to
these rays, and special precautions have
to be taken so as to bring it thoroughty
under their influence will aliminate the objection to the use of chemical antiseptics, the effect of which upon the human organism may be harmful. In an interesting paper which has reached us on the Sterill's tion of Water by Means of Quarta it is separated from the face of the work Lamps, by Dr Max von Rocklinghausen, ing by the hiast. The current of air

lit to stated that work on a very large cale has lately been do this subject, and has developed the entire system of stertification of different tire system of sterilization of different liquids used for alimentary purposes, based on the effect of the ultra-violet rays created in Cooper liewith impa made from transparent quarts. The chief work in this line has been done by Prof Henri in the Physiological Labo-ratory of the Serbonne together with Dr. André Heibronner, who co-operated with Dr Max von Recklinghausen with a view to developing an entire stariliza view to developing an entire attriliz-ing aystem of the type described. Tho pradiminary work was done by studying the action of the ultraviolet rays on different types of microbes and the infuebra of the different wave lengths. The Roux of the institut Pasteur lu which good many of the experiments were mode presented to the Académie des Sciences some of the work done by the above cited scientists Technically speaking the results so far have been the development results so far have been the development of a small water aterilizer for hospital nae whereby 132 galloos of sterile water are produced per hour frum ordinary city water by means of one Cooper Hewitt lamp type Billien," absorbing three suppers at 110 voils. Within a short time a very large sterilizing onlift hands one somewhat abuses does not be a supposed to the supposed one process to the voil of the supposed one supposed to the supposed one sup based on somewhat similar ideas will be running which will sterilize 3500 cubic feet of water per hour, this being targe enough to treat the entire water supply of a town of about 10 000 inhabit ants. The histaliation of the lamp is stated, is a matter of no difficulty all that is necessary being to connect up to the terminals provided in the dome of the apparatus and to make the justment necessary for the voltage of the particular circuit in order that the supply of water delivered from the apparatus may be absolutely sterite or stertie to any required degree it is not essary that there should be means dealing with the various water press met with in different districts complish this purpose the init pip is filled with an adjustable valve of special pattern which can be readily sel, so that when full open the delivery from the apparatus does not exceed the quantity specified this in the case of requirements being for absolutely sicile water, being 142 gatious per hour. The water enters the chamber formed by the outer cone with a swiring motion. At the top of this cone it overflows and finds an outlet at the hottom of the inner cone up which it rises and flows out at the dis-charge pipe. The awirling motion is maintained during the complete passage of the water through the apparatus in order that II may be thoroughly stirred up and all microbes presented to the artion of the tight the water coming under tion of the tight the water coming under its influence on two distinct occusions Draining cocks are provided on the ap-parstus to enable it to be thoroughly emptied should dramstances arise whereby it would not be used for a ron-siderable time. Not only does this sys-tem provide in the case of the opporator er discussion a continuous s sterile water svallable within live min-ules, but the water or any other fiquid that may be treated is unaffected as far as taste is concerned as it retains all naturat gases and sails in sciotion work of Prof Renri Dr Relbrooser and Dr Recklinghausen has also been directed towards the complete sterlitza tion of mitk, and this they have also accomplished. The apparatus for this accomplished The apparatus for this that for the treatment of water ts very transparent to ultra-violet ravs

A New Process for the Prevention of Coal-Bust Explosions.

The production of roal dust in mines

which passes through every coal mine from one ventilating shaft to another carries the dust into every part of the galleries, which may extend for several miles The distribution of the coal dust is further increased by the convyance of coal in the mine cars, which usually move in a direction opposite to that of the nir current, so that much dust is blown from 'hom. The dust senties in the carner" and on the projections of the

the corner and on the projections of the walls of he gallery, and especially on the floor and the tups of the timbers. If the mixture of air and suspended coal thust comes into contact with a sufficiently but theme a combustible gas is suddenly generated from the coal dust this gas, known as methans, or mursh gas, known as mechane, or mursa gas is mut explosive, except when it is mixed with air, in which condition it explodes with fearful violence The shock of the explosion scatters in the air much of the coal dust which has settled on the licor and elsewhere, and the heat produced by the explosion disthe neat produced by the explosion dust a fresh quantity of methane which comes into contact with the flame in this number the explosion is propagated from point to point, often throughout the entire mine

The passible means of preventing such extensive explosions of chai dust are confined to preventing the dust from rising in the air, and to disposing of the heat produced by the initial explosion effectually that the further distillation of the coal dust and the formation of gas are prevented. The heat product by the initial explosion may be consum The heat produced in the evaporation of incombustible liquids, distributed through the work The greater the quantily of such ings The greater the quantily of such volatile liquid, and the greater the extent of surface exposed to the wave of explosion, the more rapid and effectual is the absorption of heat. The liquid used for this purpose at present water It is necessary to net or sprinkle every part of the mile in which coal dist exists. This precaution is enforced by law in Germany and Anatria but not class here even in England, America, or Franco. Most of the water applied to vertical surfaces quickly runs off, and the little that remains adjoring to the surface evaporates in a few hours. The effect persists a little longer on the floor of the gallery and other hor faces, but even the puste of coal dust water that is formed on the floor soon becomes dry Hence the application of water must be frequently repeated Too frequent watering however, is la The request watering newver, is jurious to the operation of the mine. The water seaks into the persus rock and loosees it, causing danger of cay lug. In very hot mines, the rapid evaporation of the water produces an exceedingly damp atmosphere, which very injurious to the efficiency and health

of the miners The Kruske The Krinskopf process for the prevention of roal dust explosions, which has recently been patented in Germany, employs instead of water a viscous paste, of such chemical constitution that it does not evaporate apprecially nuder the in thence of the normal air current, but themee of the normal air cirrent, not evaporates raphilly when exposed to the heat of a annill explosion. Owing to the adhesive churacter of the mane, it can be applied to all surfaces horizontal vertical and inclined and in about eight times the quantity which is possible in the case of water. The thick posts, fur thermore, does not soak into the rock and as it does not evaporate in ordinary conditions it does not increase the bushists of the atmosphere. It has been proved by experiment that a condition explosion which in its minure is progressive, one he arroscied by applying this mixture to the first hundred yards of the gallery this distance being sufficient to cause the explosion to die out owing to lack of explosive material in the actual conditions of mining the original ignition of coal dust takes place in almost every case, at the face of the

possible to comme the explosions to the workings themselves and to protect the rest of the mine, without the nocessity of applying the same precaution through miles of galleries. This fact greatly re-duces the expense and trouble involved in the method. Practical experiments in the method. Practical experiments in a Westphalian mine and in an experimental gallery have proved the corrections of the theory upon which this process is based. In the mine, the waits process is based. In the mine, the waits application of the paste, but they dried up within six hours whom water was used. The explosion of 75 grains of dynamics produces a sufficiently power. In finance or upplied as mixture of coal dust and air when the walls of the gal dust and air when the walls of the gal-lery are dry, and for this reason the use of dynamite in coal mines is probibited by law The experiments prove that a mine gallery protected by the Krus-kopf process, more than fire ounces of dynamite can be exploded in a mixture dynamite can be oxploded in a mixture of coal gas and air without causing ignition. The experiment was repeated twelve times. After each blast, tho quantity of coal dust in the mixture was increased by the addition of a fixed amount of dry dust, but the application of the peate or water was not renewed in in these conditions, when water was

Colors of Poods.

Of the strong addiction many consum-ers have for the use of foodstuffe that are secretly and highly colored for the market, the London Lancet says "For some not quite ricar reason there "For some not quite riear reason them-are many popole who fook upon the brown egg as necessarily a now laid one, and honce a firl domand for brown eggs has arisen, which is castly met not by the honest brown egg. but by the white egg which has been steeped in a dye which readers it visually industragated able from the real article. Again, when mits happens to be of a but time, it is commonly hold to be here than white real article and the steeped in a dye than to satisfy this preference for a milk of a creamy shade White-looking butter is delilited as sooking too much milk of a creamy shade White-looking butter is disliked as tooking too much like dripping The remedy is simple, it is artificially colored Vegetables must be bright green to make them took fresh. the consumers of them being quite will-ing to ignore the fact that copper does not make them fresh or wholesome On

must be white.

"It is, of course, perfectly natural to take color as a criterion of the dietotic value or flavor of food, and the attracvalue or flavor of food, and the attrac-tive or unstructive appearance of food may make all the difference as to whether that food is, or is not, assimilated prop-erly. The deceit which is practiced by artificially coloring food may thus serve a useful purpose, so long as the coloring matter is barmiess, but as a rule the matter is parmiess, out as rule tae proceeding is an immoral one. It does not follow that because food is sustinctive its value as a food is sut while every form of sophistication is open to commercial abuse. A correspondent last week submitted to us a brown-abelied when the best to us a brown-belief to us the best to use t

The Always-on-Duty Telephone

Your Bell Telephone Is on duty 1440 minutes every day. So is the telephone exchange; so are the toll lines which radlate through the neighboring communities; so are the long distance lines which connect you with far-away cities and other radiating systems.

The whole Bell System Is on duty 1440 minutes a day—and if any of these minutes are not used, their earning power is irrevocably lost.

Like the Police Force or the Fire Department, the telephone is not always working—but it is always on duty and always costing money. But you would not be satisfied with the fire department if your burning house had to take its turn; nor with the police force if you had to wait in line to receive protection

You want service at once. That is exactly what the Bell System endeavors to give you — immediate attention, Instantaneous service Itstrives to be always ready to receive your call at any point, and connect you with any other point—without postponement or delay.

It would be much cheaper if telephone customers would be content to stand in line, or if their communications could be been during slack hours; or if the demand was so distributed as to keep the whole system comfortably busy for 1440 consecutive minutes a day.

But the public needs immediate and universal service and the Bell System meets the public's requirements.

The Easiest Car to Operate

YOU will not only find the I H C auto buggy the easiest to drive, but it is so simple and easy to operate that your family can use it with perfect safety On pleasure true anywhere, over all roads, up hill, through sand and mud, the I H C gets there and back quickly, safely and surely

The I H C Auto Buggy

will travel any road at 1 to 20 miles an hour The large wheels protect you from jars when going over rocks, clouds and bumps. The solid rubber trees make punctures and "blow-outs" impossible. For business or pleasure it is the most sensible, servicible vehicle. The International auto wagon has the same engine construction as the auto buggy. It will meet your requirements for a light delivery wagon. The full ellipse springs (36 inches long by 18 inches wide) and the long which base make it are yrunning and give it a spilla appearance. See an international gent or write to us diverted for further information.

OUR WATTOWAL GOOD BOARS LABORATORY

ONG the less known, but by no means less important, sections of the broad field of settive ity covered by the Department of Agricul lure, is that which comes under the Office of Public Roads. Although this office has no administrative duties and exercises no control over the roads. of the i nited States - except of course, those that are leasted on government reservations—it is doing most important work of a scientific and educational char

The nursement for Federal assistance in the protion of good roads dates back to the year 1893, where a modest appropriation of \$10,000 was made, to enable the Secretary of Agriculture to inaugurate the work To date a sum of nearly half a million dollars has been spyropristed, and if this year's estimate be in-cluded the total reaches about six hundred thousand

A full account of the growth of this i presented on another page of this issue and it gives us much pleasure to draw particular attention to that branch of the Office of Public Roads which is known as the Division of Tests. We make this special reference on account of the high character of its organization and work, and because one of our recent edi-torials would give the impression that no such divi-sion calats. As a matter of fact this laboratory as we are informed by Director A W Page, is not only coulined with the last and most improved spparatus quipped with the last and most improved apparatus
used in European isborsieris but has developed a
number of additional lents, such as those for toughness and rementing value. Routine lests are made on
road building materials free of charge for any citizen read initiding materials free of charge for any citizen of the 'hilded States and a large amount of experi-mental and research work is being carried on in-dered it is justifishly to stale that the laboratory of the Office of Public Roads is the most completely equipped road material laboratory in the world and that the number of samples tested venry is far greater than in any similar institution. As a matter of fact, the present year about three hundred typicals of the road building rooks of England Scot isnd and Wales were lested by special request in addition to the regular routine work

ARBITRATION VERSUS SELV REDRESS.

S surely as the duct loss given telace, among A individuals to the court of justice, all the awful arbitrament of war give way to the international trilinnal, also as a corollary to this it may be written down that as its court of justice has back of it for the inforcement of its of justice has back of it for the inforcement of its descress the punitive must him to of the government so will the international court be backed by some form of international polic composed of limited maxal and military forces, in which each of the signatories to

the international court will be represented.

One of the brightest augustics of the dawn of a world wide peace is to be found in the fact that it has the fashion, during the past year or two, to speak of armies and navies as means for the preserva-tion of pence. When the leaders of the world, be they presidents kings or emperors, declare that every in pressure kings or emperors, declare that every in crease in this ormed strength of their respective coun-tries is undertaken for the express purpose of pre-serving peace the statement is generally accepted as affiners. Although the advocates of peace by arbitration deplote the enormous investment of freasure, time, and labor involved in the maintenance of the wast military organizations of the civilized world they are beginning to believe that the advocates of peace by war are as anxious as they thouselves that the world's peace be permanently preserved

The establishment of the noble principle of international arbitration will be, after all, merely a repairition in the international world of a process of evolution in the international world of a process of evolutional actional world Farago inten place in the heldridual national world Farago intended to the principle of self-redress was paramount. If wrong or finite action of the principle of self-redress was paramount. If wrong or finite world w be at band Gradually, with the grown of inser-gence, it was realised, not only that the highered party-was but a poor judge of his own cause, but that the principle of self-redress was subvarrier of the peace and happiness of the community. It was realized, also, that the man whose brain was clouded with the amole of furious passion, was not so well qualified a amoke of furious passion, was not so well qualified a judge as some third and disinterested party, who could look upon the case in dispute with an impartial eys, and so, gradually but surely, the principle of srbitra-tion took shape and became the stable rock on which our wonderful modern system of national jurispru We have before us a lucid review of the growth of

the principle of national arbitration in a pamphlet published by the Maryland Poace Society and written ler lames Brown Scott lecturer on International law ley lames Brown Roott lecturer on international law in the Gorge Washington and Johns Hopkins uni-versities. He refers to the three stages which were shown in the development of the celebrated Roman judde in sustem which were as follows: (1) The private litigant submitted his controversy to an arbiter of his own chaire for decision according to the con seleve of a cool and impurited man, 121 the maste

solute of a good and fungatilal man. 121 the magnitude of pulse chosen from an official lite or paper lite preferred to a cilibea arbitrator, (3) the administration of solid lite regarded as it had not administration of solid lite regarded as the dark and fine fore the right of the State and a leading system is persoared for said imposed upon the cilibea.

The author of the pulser acces the same minimization between states in early times they arbitration between states in early times they would choose an arbitre the topic, in modern times, some foreign nonerigin. The lark of continuity of the choice in this system, which date is the lite build date. come foreign sovereign. The lack of continuity of de-cision in this system, which desit with the ludividual cision in this system, which delit with the luddividual case, left up to the second size, dating from the first conference, which lavoised the appointment by international action of a penied of judges, from which budges formulas the temporary iribunal are chosen Westard. Says the writer, "poun the very threshold of lise tilled and final development when gations as whole de-ermine that international justice is the province of the international community and count-inte a court of international justice to which litigant states may resort in coollicts of importance. To-day much has been done. The organization, jurisdiction and procedure of like joternational tribuns! have been determined Now, we merciy awall the appointment of judges to establish a world wide court, in which the

or judges to suspine a worth the court, in which the matthean may distain judice as easily and readily as private authors in national courts of judice. The author of this paper does not go laid the ques-tion of the enforcement of the findings of international arbitration it is our belief that an international court should be backed by an army composed of drafts from the various armies of the world previous in their disarmanient limited in numbers and existing solely for the inforcement of its decrees

SIR WILLIAM BESSSEE AND RIS WORK

ITH the death of Sir William Huggins there passed away an astronomer whose plonter work in the field of astro-physics y pioneer work in the nets of matro-physics the history of acience it was largely due to Bir williams genius that the apectroscope became an lostrument of astronomical investigation bardly less important than the telescope. His work was done so loany years ago, and its results have been so farreaching, that it is easy enough to value it at its true

Huggine began his studies shortly after Kirchoff Huggine began his studies shortly siter Kirchoff applied the terrestrials science of spectrum snalysis to the study of the sun Parity as a result of lingsine's efforts astronomers have been enable to observe the solar prominences at any time, without erry the solar prominences at any time, without willing for an eclipse, for the principle of spectra-copic viability of prominence lines at the edge of an uncerlipsed sun was quite explicitly stated by him in February 1888. He even devised various instruments or hringing the prominences into actual view. His use of the 'open silt' on February 1889, may be add to have begun the modern study of sofar prominences. Meters the days of the 'open silt' or prominences had been azamined only 'no sections' or more actually the study of the 'open silt' or prominence had been azamined only 'no sections'.

nences had been axumined only in sections. The first templite results is the estimation of movements of approach and recommon between the earth and the stars, by means of Doppher's principle, were communicated by Sir William Huggins to the Royal Society on April Start, 1886. Application of this method is the stars is eccompassed with difficulties; for it needs a powerful disperses to show a minute line of displacement, and powerful disperses to show the star is secondaries.

eion involves a strictly propertionate enterphisms of light. Helpoing the brightest star in the histories as the most promising subject of experiment, Mugal considered the F line in the spectrum of String to considered the F line in the spectrum of String to just so much displaced toward the red as to insit recession at the rate of 38 miles a second. The inqui was reasuned by Huggins with improved apparatus the following year, when the velocities of thirty at well and the second of the second of the second William Huggins's schlerement was not, however William Haughts's coliverensis was not, because of center the mytom in the proof offert the mytom in the proof of the center that the method of preserving state. He method has been of incellatable value, so much as, that spect monopies resistant the method of preserving state. He method has been of incellatable value, a leading part affirm that the proof of the preserving of the rest and complex resistance she when he will be supported to play a leading part affirm and the preserven now we distributed the state of the preserven now we distributed the state of the preserven now we distributed that the state of the preserven now we distributed that the state of the preserven now we distributed that the state of the preserven now the state of the preserven now we distribute the state of the preserven now the state of the state o

Many and parts

ceived to be self-luminous and to be formed, to as extent, of glowing gas. The next step was to mine he nature of this gas, a problem first att by Sir William Huggins in 1868. Winnecke's o

In the field of stallar spectroscopy ruggests is assuredly monumental Almost simultaneously discovering the stallar spectroscopy was entered sizes. The stallar spectral in Roms, and by Lewis M Rutherfurd in New York gins ma) well be considered as one of the fathers of gins may well be considered as one of the fathers of stellar spectroscopy. When he brought to a successful submination his early experiments in spectroscopic photography, we restly began to learn something of the composition of the fixed stars. On December 188s,

the composition or one naces stars. On Increment parts in 1379, he was able to communicate to the Royal Society results surwering to his expectations. The dry-plaine process, with which such wonderful results have been obtained in astronomical photography, appears to have been first made available by sile willism. Muggline in photographing the spectrum of Vega in 1866 That work jaid the foundation for the brilliant application of photography is astronomy by Common, Draper, Janusen Rutherfurd, and later as-

A lairly complete preliminary answer to the ques-tion, 'What are the stars made of'" was given by SIT William Huggins in 1864 By laboriously com-paring stellar dark lines and the bright rays emitted by terrestrial aubstances he sought to verify his con-clusions regardless of cost in time and trouble. Al-though he himself sverred that the full investigation of a single star spectrum would be the work of years, be was able to furnish however detailed and accurate

drawings of the spectra of Betelgeux and Aldebaran Before Huggins applied the spectroscope to the sindy of nebulae, it was felt that these mysterious, filmy objects of light would forever thwart the astron Such new and more powerful tolerscope that made its appearance had resolved into clusters stars which previously had appeared to the naked eye as single order it was felt that those filmy stars which had resisted all attempts at telescopic resolution might be similar clusters, for which reason some dou spining fluid

ugust 29th, 1864, Bir William Huggir through his prisms the rays of a bright planetary nebulæ in Draco. To his infinite surprise, they proved neous in Livaco. To all indinis surprise, tary provise to be of one reior mainly and thereby preclaimed their gaseons nature Thus Herschel's conjecture of a "shining full' diffused at large throughout the common was unexpectedly verified. By 1868 Huggias had sep-urately examined the spectra of about seventy mebals, of which one-third displayed gaseous characteristics. of which one-third displayed gaseous characteristics. All of these gave the green ray fradamental bits be solved in the spectrum and emanating from an unknown form of matter ansmad by Ragista, "solvium." A successful beginning in solviar spectragraphy was made by fits "William Huggins one' March 17th, 1888. Five lines in all stamped themselves upon a plate, expended to the rays of the sebula in Orlino. However, was photgraphy definitely made the series of the relationship.

nabulas

The effect of Huggins's work has been to remore the
astronomy from the ere-piece of the telescope, to unbstitute for the retina the more sensitive photographic
plate, and to teach the astronomer the immessivable

astronomer the composition plate, and to beside the servicemen instrumentarial value of the spectracrops in analyzing the composition of stars which in the intercope appear is more highly related in a make canopy. Hungshap introduce physical methods too astronomy and theselvate the observatory has a knowthry.

Another new monopiane that has flown successfully to that of Mr. Gardner Hubbard, which was built by Mesers. McCorff and Baldwell, that Baddeel, Canada This machine is a cross between the Bierlot and Antiente types. It has 800 square feet of support surrance, the overall length being 34 feet and the aprent of the wings 50 feet 2 inches It weights compete about 1,000 pounds without the aviator, a 40-borney power, size-springer weter-cooled motor of 250 pounds weight furnishing the motive power The propeller in driven by surveyeas and chain, with a gear reduction driven by surveyeas and chain, with a gear reduction ven by sprockets and chain, with a gear reduction driven by aprochets and chain, with a gear reduction of three to five, On April 8th, nise flights were made above the ice on Lake Bras d'Or, hy Mr. Hubbard, who had nevar Sown before. The monoplans reached an elevation of about ten feet, and flew sevaral hundred

In a recent aeronautic note we mentioned an aero plane flight of five minutes duration with four pessengers. As a matter of fact M Roger Sommer took but three passengers with him ou his record breaking fight of April 20th. These were Mile Dutrieux (46 s, 96 pounds) and MM Colombo 160 kilo grammes, 132 pounds) and Frey (58 kilogrammes, 128 pounds) Sommer himself weighs 151 pounds. The total live load was \$10 pounds, and the weight of the hiplane tive load war 110 pounds, and the weight of the hiphane complete was 560 pounds, making a total weight of 1,000 pounds that the 10-horse-power domes motive raised in the air in 50 seconds. The weight-lifting shielency of Sommer's mechine is therefore 50 pounds. The preprious record of this kind was made by Haury Narman with a similar machine when he cor-ceed 10 kilmenters in 10% institute with two posen-gars weighting 110 hilogrammes plus 10 kilogrammes

of ballant.

On the 9th instant Heasen, A. H. Ferbes and J. C. Transi made an accommon at Quincy III, In the former's present of the property
ELECTRICITY.

By ming a sections of the sensitive telephone relay, the heart bests of a patient in London were transmitted to the home of John Milne, the noted seismologist, on the Laie of Wight. The heart throbs were heard by four physicians over an ordin throbs were heard by four physicians over an ordin-ary telephone, and so clear, was the transmission that it was possible to diagnose the heart troubles. It is expected that this use of the stethoscope with a telephone relay will enable physicians to keep in bet-ter touch with their patients.

An electrical thermometer which is very sensitive to alight fluctuations of temperature, has recently been put out by a German company for medical use, to determine the degrees of favor It consists of a coll of platinum wire inclosed in a quarts glass tube. through which a current is passed from a four-voit storage battery. The tube is placed in the armpit of the patient, and a milli volumeter indicates variaof the patient, and a milit voltmeter indicates varia-tions it the resistance of the coil, due to the heat of the body. The milit-voltmeter traces a tempera-ture curve on a band of paper, and in this way it is possible to atudy the action of drugs on the patient.

According to a recent press report, steamships of the French trans-Atlantic line are using the apparto a French trans-attainte line are using the appar-atus invanted by Signors Seitini and Tosi of the Italian navy, by which wireless messages may be transmitted in and received from, any desired direc-tion. The particular advantage of this apparatus on shipboard is the fact that it enables the operator to determine from what direction a signal is coming. determine from wat direction a signal is coming, and the course of the vessel can be governed accordingly. Recently the "Provence" crossed the Atlantic, equipped with this apparatus, and was ab'e to determine the positions of various vessels passing in the vicinity. The danger of collision was thus entirely

An interesting paper on insulating materials for wireless talegraphy was read recently before a meet-ing of the Wireless institute in this city by Mr Stan ley M. Hills. He pointed out that rubber is not perley M. Hills. He pointed out that rubber is not per-manent, but spit to destrortes, that marble is hydro-scopio and not to be relied upon because or its irregu-lar composition, that porelain is age to contain hid den defects, and that giass, while the defects it con-tains may be destread visually and thus avoided, is extremely fragile Hs spoks of mice and of wood as good issuitators if kept dry, and dry oil is and of the spit of the period of the period of the period timulator for the reason that it is itquid and "self-henling" Dry air makes an excellent insulator, and for high voltages, compressed air may be used

The advantages of an electrical shovel over a steam shovel have recently been portrayed, showing that wherever electricity is available at moderate rates. the electric shovel is much to be preferred. One of the great objections to the steam shoval is the fact that the expenses of a fireman must be paid, and the fuel, as wall as the water, have frequently to be carted for a very long distance. Steam must be kept up continuously, despita all delays in operating the shovel, while for the electric shovel the name arguments apply as are made in behalf of electric drive in machine shops, namely, that when the shovel is idle there is no consumption of power, yet the power is ready for instant use whenever it is needed

is restly for Instant use whenever it is monded. An interesting discussion by Dr. Charine P Steinmets on the magnetic properties of materials were published in a recent number of the Electrical World It was stated some years ago that magnetic alloys could be made by combining non-magnetic matings. Dr. Steinmets points to the fact that is all the freuer large managenees is used, and that this is ellightly ferro-magnetic One of the simplest of these alloys recolasts is combining one part of managenee with three parts of autimony, the mixture being made by powdering the mains and then beating them in a test take. The result is a black goveler which its around; alloy has been found which does not contain some of the ferro-magnetic group—lron, cobalt, nicksi, managenee, and chrontism. the ferro-magnetic grou

Now that air craft have been entersels, invantors are beginning to cast about for some effective means of destroying them. Recently an serial tornedo has been invented, which, by means of a Hertzian wave controlling system, may be on a nerusina wave controlling system, may be directed from a distance without carrying any oper-ator. This dorpedo was exhibited at the London Hippodrome, where the townter caused it to traval out over the andience, sterling it wherever he chose by pressing buttons on a switchboard on the stage by pressing buttons on a switchboard on the sing The topped is provided with two servers, which may be operated independently to steer the ship interact, while a horizontal rudder serve to steer the reser-veriestly. The device may also be equipped with accidentive, to be dropped on the senser when the horizon has been masservered to the right position. This, was demonstrated at the Hippodrome by relea-ling Strippe, eq. the admission.

SCIENCE

Bewerd B. Gerriott, chief forecaster of the United States Weather Bureau, died recently at Washington at the age of 8? He had been connected with the Weather Bureau practically since its cetablishment, which means for forty years

After thirty months' cruising in Philippine waters, the Fish and Game Commissions steamer Alba rices," Commander C M McCormick, United States Navy, entered the Golden Gate, San Francisco and dropped anchor The "Albatross" has been engaged in a thorough examination of the San in Philippine

When one solid body gildes over the surface of an wass one solid body gittee over the surface of an other, the coefficient of friction diminishes as the ve-locity increases and nearly vanishes when the ve-locity attains a certain critical value. This diminu tion of friction is due to the air which partially sepa rates the two bodies at low relative velocities and rates them completely at the critical and all bigher velocities.

Dr Douglas Mawson, who accompanied Sir Ernest Shacklaton on his last Antarctic expedition, arrived recently in this country, bound for Sydney New South Wales, to resume his duties as lecturer on geology in wates, to resume his duties as incturer on geology in Sydney University Dr Mawson reiterated the state-ments aiready made by Sir Ernest Shackleion that there is an immense stream of coal within 300 miles from the South Pole

from the south rote.

An interesting method for measuring the transparency of developed photographic plates has been developed by the property of the property their optical axes, will reduce the angle of 90 deg extreme brightness and maximu by an amount proportional to the density of the sit-

The emission spectra produced by certain elements cated in quartz tubes to 2500 deg F have recently been studied it is found that in these circumstances aulphur produces a blue light and a nearly continu ous spectrum Selenium gives a pale yellow light with bands, which are generally well defined, but be come uncertain toward the red end Tellurium emits a green light and its spectrum contains numerous bands which are also hazy toward the red end Phosphorus and sreenic give a white light and continuous spectra, while autimony produces a nearly continuous spectrum, crossed by very ill-defined bands

The distinguished German chemist Ostwald has taken out a German patent for the improvement of drawing inks and water colors. He has found that by the addition of small quantities (from 1 100 to 1 1,000) of volatite organic compounds of the aliphatic series, which are soluble in water, at least to a small extent and contain not less than four atoms of carinks, drawing inks and other water colors s rendered capable of readily marking such surfaces as rendered capable of readily marking such surfaces as parchment livory, waxed paper etc in the case of neutral liquids, an sicohol, ester, or other neutral sub stance is used, white to sold inks, free fatty solds, such as valeric or caproit at d may be added

How bright is the sun? No two authorities agree Another estimate has recently been made by t' Nord mann. The effective temperature determined with his pyrometer was found to be about 5 320 deg she Now, the brightness of an incandescent body emitting te light varies sensibly as a function perature, and this law has been verified by compari son with numerous terrestrial light sources. Taking into consideration the absorption of the solar atmosphere, the effective temperature of the photosphere is probably about 6,450 deg absolute. The correspond is proceasily about 6,400 deg assolute. The corresponding brightness of the mean effective layer is then about 319 000 decimal candles per square centimeter. This noiar surface is thus considered to behave very like a hisck body, and to have an emissive power of nearly unity

Ducellies has made a study of the chemical char-Procelles has made a study of the chemical char-acter of various alloys of cobait with tin, antimony hismuth, lead, and copper, by measuring the dif-ference of potential between each alloy and each of its constituents, when immersed in a solution of to constitute, were immersed in a solution or cobait sulphate. The results are expressed in graphical form. The curve of the cobait-tin alloys shows a distinct inflection at the percentage of 68.76 of its, which corresponds to the compound CoSn. The cobaitantimony curve indicates the existence of two definite compounds, CoSb and CoSb,. The cobatt blamuth at loys also show two distinct compounds. The electromotive force produced by most of these alloys is a very small. The curves show that in the separation of the two metals by the process of solution, the cobalt remains undissolved in practically pure condition, while the solution of hismuth contains about 5 per cent of coheit. The behavior of the coheit lead alloys as similar to that of the alloys of coheit and hismuth.

Liffel's Recent Experiments on the Resistance of the Air

BY JACQUES BOYER

Elliulus first experiments on the resistance of the air, a problem which is now engaging the attention of many accentized because of its importance in sericantics, were made in 18074 at the famous Biffel Tower, which was constructed for the Paris Browletian of 1895. The surriess on which the pressure of patients of the second story of the tower, in connection with a chrosoprephic apparatus, which recorded the resistance opposed by the air, which recorded the resistance opposed by the air story of the content of

16. 101d.

The velocity of this ranged from so to 180 feet per account. The appa-ratus was guided in its fail by a vertical cable, and was prevented from striking the ground by a pro-gressive enlargement of this cable grossive enlargement of this cable beginning at the height of about 70 feet from the ground. In this way the falling body was gradually brought to rest by the action of spring brakes. A tuning fork, making 100 vibrations per second, was attached to the surface. To was attached to the surrace. To one of the prongs of this tuning fork was attached a style, which as the fork vibrated, moved verti-cally over the surface of a vertical cylinder, which was covared with paper roated with lamphlack, and was caused to revolve with a sp was caused to revolve with a speed proportional to the velocity of fall Hence the record takes the form of a fine sinusoid, the median line or

a fine sinusoid, the median line or axis of which forms an irregular line around the cylin-der Each point of this axis corresponds to a certain position of the falling body. The number of undus-tions between this point and the beginning of the trace, gives the time; the ordinate of the point inditimes, gives the time the ordinate of the point insti-cited the institute of the springs, and consequently the pressure of the fir on the surface, at that instant; and the abcins is preportional to the distance through which the body has fallen. Hence the trace gives the position and velocity of the body and the resistance position and velocity of the body and the resistance position and velocity of the body and the resistance in the position of the second of the second of the second Eiffel apprimented in this way in the proposed planes surfaces, and even with appearing directair, continues, and cut or perforated, with groups of superposed planes surfaces, and even with appearing and conficient pro-fer surfaces and were with appeared and conficient presidence the surface of the surface of the surface of the velocity. The approach of the relative square of the velocity. The approach of the relative square of the velocity. The exponent of the valocity differs very slightly from 2 and appears to increase regularly with the velocity, passing through the value 2, at the velocity of 110 feet per second. The pressure per square inch was furthermore found to increase with the area of the surface

each other is very great. In some cases the resistance is smaller for a group of surfaces than for a single surface. For surfaces inclined to the direction of the wind, Effel formulated in 1908 the following law For wind, Siffel formulated in 1805 the ronowing law row inclinations to the horizon varying between 0 and 30 degrees, the pressure is proportional to the angle, while for inclinations greater than 30 degrees, the re-

In order to extend these observations (which have

which was referred to in the French journal, I am of opinion, personally, that Paulban actually attained

an elevation of approximately forty-six hundred feet, for the following reasons.

1 The official figures were taken by two transits

set one thousand feet apart. The solution of the ob-tained triangles gave him an altitude of 4,165 feet. The method and computations of the triangles were undoubtedly correct. The error, if any, was due to the fact that he attained his maximum height when crossing the line joining the transits. This so appeared to me At that time, owing to the acuteness of the angle of elevation, it was impossible for either transit to take a reading, both being interfered with by the horizontal bases of the instruments. The maximum height as taken by those transits was when Paul han was distant from the base line approximately one mile.

2 Panihan had with him an anerold barometer, corrected but not sealed. Ha stated that this regis-tered a maximum of 4,500 feet (after being reduced

From meters).

3 The maximum height as taken by Capt Samuel Bottoms, Coast Artillery Corps, U S A., and myself with a "range rake" was 5,387 feet., "From all of the above 1 am of the opinion given above, vis., 'that Louis Paulsan actually attained a

NOW ORIGING IS SOLVING ITS MAPID TRANSPIT PROBLEM. AT D. R. STREET

The city of Chicago has been hard at work rehabili-The city of Chicago has been hard at work rebabilities its unrives extractor avaisant, and compilating plans for the new subway littles. The engineers of the city have estimated how many passengers enter and leave Chicago's six square miles of business are very treasty-four hours, and the results prove that the present lines are hopolessly overworked During or committee of the past year? It was found or committee days of the past year? It was found to the past year? two normal business days of the past year it was found that on all of the lines running into the down town districts bounded by Chicago Avanne on the north, by Twelith Street on the south, on the west by Haisted Street, and on the east by Lake Michigan, an area of about at sequence mites, every zeventh passenger was without a seat. When it is remembered that he service cannot be improved much along present lines, it is clearly seen that a subway is importative at a conservative sections, the maxif generation will describe the service cannot be improved much along present intend. At a conservative sections, the maxif generation will trict of the efty equal to all facilities now available from the central part of New York city, with all its from the central part of New York city, with all its ferries, tunnels, subways, bridge and enriace lines. To meet this need, the engineers have planned a sysch it is believed will adequately meet this

great demand for cars during the rush hours
The completesystem will be bounded on the north hy
Chicago Avenus, on the south hy Twenty-second Street, Chicago Avenua, on the south by Twenty-second Street, on the west by Haisted Street, and on the east by Wabsah Avenue Four terminal stations will be built immediately at the boundaries of this subway zone, one at Chicago Avenus and North Franklin Street, one at Dearborn and Twenty-second Streets, another at Dearborn and Twenty-second Sireets, another at Van Buren and Hairde Sireets, and the fourth at Randolph and Hairde Sireets. The new underground will begin where the four cloward lines now enter the district, and all surface cans from the respective quarters of the edity will also converge at these four terminal stations, where all surface and slevated cars from the resident districts will become subway cars, and will remain under the surface outlit they again pass ont of the district.

ont of the district.

As shown in the front page plan, a four-track route
will run close to the surface of Wahash Avenne from
Chicago Avenue to Twenty-second Street This route
will carry all through cars from the South and North will carry all though cars from the south and North fildes, two tracks being exclusively for surface cars and two for elevated trains. After passing to the opposits limit of the district, the trains from each direction will turn about and will return to their

respective starting points by the sams route
From the West Side of the city two tubes will run
in beneath Randolph and Washington Streets as abown in the accompanying plan, and will turn south-ward on State Street, and then return to the West Side under Adams Street and Jackson Bonlevard After coming out into daylight at the Halated Street terminal, these cars will also scatter to all points on the west side of the river

To complete this first stage of pian one will cost about forty millions of dollars. Its capacity will be fifty per cent greater than that of all the traction lines now operating within the district With the aid of surface cars to make abort hanls within the district, this plan will serve the needs of

business district, this plan will serve the needs of the city for many years.

An additional expenditure of forty millions will then build the second stage of this plan, when other the stage of the second stage of the plan, when other this stage of the development will be found both loops and through routes for all parts of Chicago. Yet where the various trunsels cross one another there will be no grade crossings one tube will dip in its course so as to pass completely under the other line than will allimate all daagen of underground colli-rias will allimate all daagen of underground colli-

A further expenditure of thirty-two million doll A further expenditure of thirty-two million dollars, will serve to complict the system, when every street within the enlway zone will have because it is branch to the system of the system of the system of the system of the entire district will be seyed by the most ellowate, yet the most efficient will be seyed by the most ellowate, yet the most efficient, suffery system in the world. This plan, in its completed form, will cost about one handed and vertex millions of deliars, and will serve the needs of the city at its present rate of growth will like improve the state of the city at the property of the city at the present rate of growth will like improve best desired and temperature.

mill 1850 Improved nesthods of transportation will probably cause the business district to expand, and the subvey will be built secretary it may nitratify be possible to remove verry yeard or rail and every ear from the surface of dever-form streets. On our frust page is shown a cross-section of one of the future existence on Wabash Aventso. As seen in this picture, the tracks its close to the street surface became or the danger to certain building foundations, is lew-level subvey is impracticable, and the contest of the probletter as the sutre subvey is to the contest, the picture of the probletter as the sutre subvey is to the contest, the probletter is the contest of the probletter as the sutre subvey is to these cases of the subvey will must be so possible to the contest of the contest of the subvey will must be so possible to the contest of the subvey will must be so possible to the first of the contest of the subvey will must be so possible to the later heavy presence from any side.

and the engineers have worked out a type of con-struction to meet this requirement. Stations of this type will be built in the conter of every hick on Wabash Avenue, and the platforms will be but a short distance below the sidewalk level. Underground walks will afford opportunity to cross the streets, or wans will amore opportunity to cross the streets, or o walk parallel to the car line, past the basement indows of the department stores. The cars will include the most modern improve-

The cars will include the most modern improvements, such as side entrances, to permit the rapid handling of passengers, provided with automatic signals to show the molorana when all the doors are closed. The use of these cars will greatly reduce the length of stops at stations. The plans also provide for the bousing of all underground utilities in suits chambers. Berry public service corporation will have its own chamber, as shown on the freed-pass agraving, in which will be accommodated all of its pipe lines when the property of the provided of the property of the provided provided the property of the provided provided provided the provided pro will be taken to provide for the future water supply, a very vital provision in the consideration of the future needs of the business district. These chambers will be easily accessible from the street surface, so that it will be a simple matter to imspect or repair the pine lines of any company. The cost of this gal-lary construction has been included in the foregoing figures, so that an expenditure of one hundred and twelve millions of dollars will give Chicago a com-plete traction system, and the best possible provision

for her public utilities.

This comprehensive plan is the outcome of severa months of investigation by City Engineer John Eric-son The result is a scheme of construction that is well adapted to meet the peculiar needs of a city well adapted to meet the peculiar needs of a city that has its entire bushess interest within an area of six square miles. Whatever slight variations may be made in the plens during the progress of con-struction the scheme for construction as here de-scribed will be the general foundation for whatever suhways may be built

The words "sanitarium" and "sanatorium" are popniarly understood to have the same meaning and are generally used interchangeably, when designating (or g) places of refuge for sick people but there is, in fact, quite a distinction between the meaning of the two words. In answer to a correspondent on this

the two words. In answer to a correspondent on this subject the Liferary Digast says
"The distinction between these words lies in the fact that they are derived from two different Latin roots. "Sanatorium" is derived from the late Latin roots. Sanatorium' is derived from the late Latin generatorius, meaning hardin joing. The 'erm relates specially to 'an institution for treatment of disease or large salarial benepacitic aerias or conditions peculiar to the locality, or some specific treatment, or treating patiental thesess. On the other hand, 'annitarium' is derived from the Latin sensites from some meaning shollow or sould 'Sanatarium' relates more specific solution of Sanatarium' relates more specific. cally to 'a piace where the hygienic conditions are preservative of health, as distinguished from one where preservative of health, as distinguished from one where therapeutic agencies are employed. Hence it is the province of a manitarium to preserve health, that of a manatorium to restore it. Care should be exercised in combining the proper vowels in these two words in order to indicate correctly the derivation"

In our issue of May 16th we published an article on the utilisation of wireless talegraphy in connection with a Chalmers-Destroit automobile in the Gild den tour Through insofverience, we neglected to state in the article that the wireless installation was gavined by Dr. Lee De Forrest.

THE CARTAGO RABTEQUARE.
BY PROF OUTSIAN RUGADO, CONTA BICA PATE COLLEGE.
On May 4th, at 6 50 P M, the city of Cartago, former capital of Costa Rica was wiped out of existence by an explosive earthquake which lasted but a few

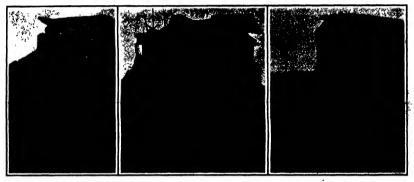

seconds The destructive motion was mainly vertical and began suddenly, that is, without the premonitory shorks which usually give most people time enough to run out from their houses. Immediately after the beavy up-and-down motion came a long series of smaller

shocks had somewhat decreased in number and in-

tensity when the fatal issue came.

Cartago is situated at an altitude of 4,700 feet, at the very foot of the huge voicene Iran, which towers 11.500 feet above see level. The Iran voicene is considered as extinct, the only remnant of its former activity being a few fumerolles or steam jets, located alderable distance from the new silent and cold craters. At no time before or after the estastropi craises. At no time before or after the extestrophe have the funanciales shown any arraptom of increased activity. Moreover, the asimograph, in Cartage gave for most particulates a direction which was almost purposedistia; to that of the viplano. Therewere, after the destructive shock, the direction of the outbornakes because variable, and for fione of them confided with that of the Trans. On May 44 the needle of the apparatus began writing the last chap-ter of the drams, and while so doing jumped out serour or the strains, and while so dering jumped out served times from the giase plate. Then the selemo-graph, which is a heavy invested pendulum contained in a box some three fact high, was violently thrown against the wall; the giase plate thi from its shelf,

against the wall; the gram are and we broken in the same and we broken in two. Among the public buildings which are in ruins in the benutiful Philos of Piece, & just of Mr Andrew Corporer To Repelace had yout been completed, the in-

and experiment, what to do when a fire breaks out in his own house. He should be instructed how to go to work coolly and methodically either to extinguish -if necessary—to escape from the Lessons of this bind, imparted by practical meth-ods, would become a source of strength in after life and would go far to check the recurrence of fire out

NOW TO ACT IN CASE OF FIRE.

hreals, with their entalled loss of life and capital Take, for example, the case of an overturned oil There is a sudden and alarming biaze, but if action is taken at once, the damage may be confined action is taken at once, the damage may be confined to the extract, either or what not upon which the lamp actually like. To thorw water on the confineration is useless. The birarian coll will either the force of a larger area. The dam should be to abour the oil and mouther the fannes are most as possible, and this may best to done by means of some son-finemable provider—done is flow, sand, earth from the garden

powder-such as Bour, and, earth from the garden or anything of the kind Another point worth remembering is the use of the sode-water ayphon as an extinguisher Suppose that a kump or candle has ignited a curtain and that the a mmp or cancus mas ignited a certain and that the finner has run up the fabric. A syphon or sook assier held as shown in the accompanying photograph, and squiridd over the fiames, will work wonders. Not outly does the force with which the liquid issures the table above of its being directed well above the operawet handkerchief over the mouth and nose then crawl on the hands and knees, for the smoke tends to ri-with the hot air and will be less dense close to the

But if the whole of the lower part of the house is burning and cscape by means of the stairs is impossible preparations must be made for leaving through the window. The all the sheets and biankers together by means of 'reef knots which will not slip no by means of 'rev'knois which will not slip no mait ter how much strain by not upon them. Then drop the bedding or maitress from the window in order that there may be some kind of break in the event of a possible fall. Plinally make one end of your improvised fire-examp fast to the bedpost drop the other end from the window, and after making sure that it ranghes to or almost to, the ground go down it boldly hand over hand. It should be added that in the case of interesting dispresses there is a second to the case of interesting dispresses them. of inexperienced persons there is always considerable risk of a dangerous fall resulting from this means of exit, therefore it should be undertaken only when all

other means of escape have failed
In conclusion a few words may be added r ing the treatment of burns and scalds prior to the arrival of a doctor. The main point to bear in mind is that the air is to be excluded from the affected part as quickly as nossible This ma This may be done by

HEAVENS IN JUNE THF.

BY HENRY NORRIS RUSSELL, PHD.

UNE, though less exciting from an as-tronomical standpoint than May, is still a month of more than usual in-

Hailey's comet will, of course, still Halley's comet will, of course, still be the main object of attention. At the beginning of the month it is cellently placed for observation, about midway between Regulus and Alph-

midway between Regulus and Alph-nard (cf. Hydrase) on a dark sub-setting after 11 P M it will how-ever be much less compleuous than the week before, and will seem to shrink and rade rapidly as it recedes and will see from us. Its distance on the ist is about fifty million niles, and this increases steadily, at the rate of three and one-half million miles a day--to which the earth's motion in one direction contributes about one and one-half million miles, and the comet's motion in the

posite direction the remainder its apparent motion in the sky is slow, for it is

moving simust directly away from us it still travels castward and southward among the stars, continuing the line of its cariler path but very much more slowly. covering only 13 deg dur-ing June, and 5 deg during July

During the first ten days of the month it will still be a fine naked-eye object. Then the new moon will begin to flood the evening sky with light, and drown sky with light, and drown it oul By the time she is out of the way again the comet will be 125 mil ilon miles from us, and equally far from the sun, so that little can be seen of it without a field glass.
With the aid of the latter
it can probably be followed all through the

The display which this comet has given us dur lng May is probably the finest of the last fifty Venn

Curiously enough, its ter-century is the great unexpectedly last January This was at one time much brighler than Hal-ley's comet (owing to its (lose approach to the sun) but its tall was not so long and it was too deep in the evening twilight to be seen to the best advantage

Daniels comet of 1907, though intrinsically of about he same magnitude as Halley's comet, was never within fifty million

miles of the carth, and so never afforded nearly as fine a spectacle

Back of this is a long barren interval. The last previous counts which was at all conspicuous to the naked-ye was the great one of 1882. This was one of the grandest ou record, and had a tail over 100 nvillion miles in length but this was directed almost away from the earth, so that it never looked more away from the earth, so that it never looked more than 5 deg long—as against over 80 deg for Halley's comet before it left the morning sky Before this comes Coggains comet of 1874, with a tail of 80 deg long but the last comet, fully comparable in appearance with our visitor of this year, is the great comet of 1861, whose tail was at one time 190 deg, in appearant length As in the present case, the earth passed through the tail without any sensible effects other than a general illumination of the sky on the night of passage. Three years earlier, in 1854 on the night of passage. on the night of passage intro-years earlier, in 1806, appeared Donati's come! by common consent the finest of the last half of the nineteenth century

of the last half of the nineteenth century Several of these comets, especially that of 1883, were really much largor affairs than Halley's, but the very favorable circumstances of the present rewere really much larger annirs than Halley's, but the very favorable circumstances of the present re-turn make it comparable, as a specialit, with any of thems, so far as can be judged from the records "The last nows at the moment of writing is that its

ad proved perfectly transparent during its transit across the sun, and that its tail is so much curved in its own plane that the earth did not reach it till long after daybreak on the 59th Before dewn this morning it was a magnificent object, extending from the asstern horizon half way across the sky, till it was look in the Mility Way its total length up to the invitable head was rully 13e deg., according to be convertaints here, and 16 deg as seen at the Liok Observation; a few the REAL STATE of the STATE ng after daybresk on the 19th Befo

Total Control A CLOSE SECT. THE LABOR DESIGNATION OF

s of the "Dr These have been many mediatetions of the "Dread-negate" design since it was first introduced in 1905. he American medification is distinguished by the most-line arrangement of the gun turrets, the German eful secondary armament and by the re-duction of the triple turret. It has resained for italy—the home of constructive genius and he real birthplace of the dreadnought itself—to com-tine in one ship the twin turret, the triple turret, and

the cooler-line arrangement.

"Pour abbr as well as the construction for the Meditor-reness power 900, the "Duate Alighiest" was ladd fewer last seamers, and is to be leanning the seamers, and is to be leanning the seamers of the seamers, her power has been seamer as the seamers of the sea

they were to carry eight 14-inch guns. It sow turns out, however, that they will have no fewer than thirteen 12-inch weapons. This is a larger number of sin-gle-caliber guns than has sver been mounted in a modern ship, although the Japanese "Satnuma" and "Aki" such carry four 12-inch and ten 10-inch, to earry four 18-inch and ten 10-inch, to say nothing of twelve 6-inch The ar-rangement of the guns in the Italian ships in distinctly novel. There will be three-three-gun turreta, one forward, one att, and one amidships, while a twin turret will be placed forward and aft, so as to brink its guns to bear over tha lower turret. There will thus be a roit ide of thirteen 12-inch guns, w

aronatore of intressur 15-inch guis, white a forwards 4.7 fire of five 1 The secondary battery will consist of sighten 4.7 inch rapid-fire guns, besides the same number of 3 inch. Three under-water torpede tubes will be fitted. The displacement will be 24,000 tons, the main armor belt 13 inches thick, and the speed 22 knots

and the speed 22 knots.
The arrangement of the armament in the "Dante Alighier" is precisely the same as that in the other three skips, ask that its midsholl parret is appressed, and that the affer turrets are on a lower level than those forward as will be seen from the accompanying aketch, the desk runs straight from low to stern in the three other skips. The "Dante" will have a displacement of 18,500 cons and a speed of 33 knots. The four akips are to be completed in 1911.

BOW THE LAKEVIEW GUILES WAS CAPPED.

Last week's issue of the Scientific Augs tained a description of an oil well in the midway dis-trict near Bakersdaid Cai, which on March 15th aud-denly blew out the drilling tools and became the Lake-

Gusher, the large oil gusher in California. oil gushor in California, blowing out at the rate of over 40,000 barrels of heavy crude oil a day Tha force of the gas pressure was so terrific that the derrick was ripped to pieces, and oil spray was every direction. How to problem. For egyeral weeks no attempt what-ever was made to check ever was made to check the flow. A tentative at-tack was then made to fasten down a wooden roof over the head of the well

ough the roof was n nade of 16 by 16 timbers, the

gusher tore them to splinters.

The following plan was then successfully adopted.

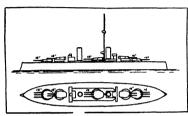

The gusher had by this time broken out in several The coloring pain was ten sections of the section of painters believed by read and said. bies, which had served to hard up the raft, were then made fact to berief pipes. The result was that the stream of oil was haried against rhat was virtually a raft anchered in midair. The raft, held up by the force of oil, is about 15 feet above the mouth of the well and just above the etockade. Although this force ont actually sitellie the grash of oil, it has very much lowesed the height of the fountain, and thus has re-sulted in a wast asking of oil.

A National Good Bonds Laboratory.

A National Good Bonds Laboratory, The Agricultural Appropriation Bill approved March 7rd, 1818, contained an item appropriating 10,000 to enable the Secretary of Agriculture to make out the United States, to make investigations in re-gard to the best methods of road making and pro-pare publications and sasist agricultural colleges and speciment exitous in disseminating information on

NEW ITALIAN BATTLESHIPS WHICH WILL BE THE FIRST TO CARRY THIRTER TWELVE-LINGS GUES.

this subject. In pursuance of this authority, the Of fice of Road Inquiry was established During the next two facel years the appropriations and the wording of the hill remained the same The appropriate for the facel year. 1857 was reduced to \$8,000, and a provision was added authorising the investigation of read-making materials in the several flattes. The appropriation requision \$3,000 annually. States. The appropriation remained \$5,000 annually during the facel years 1888, 1899, and 1900, and no change was made in the wording of the hill, although the name of the effice was changed from "Read Inquiry" to "Public Road Inquiries" in the facel year

The Agricultural Bill for 1901 carried an appropri-ation for \$14,000 and provided for conducting experi-ments in the city of Washington and elsewhere and ments in the city of washings and enserter and collecting, digasting, reporting, and illustrating the results of such experiments. The appropriation for 1903 was \$20,000, and the bill provided for the in vestigation of the chemical and physical character of road uniterials. The language of the appropriation work of the office is divided into three hranches, namely, the laboratory work, which is organized as the Division of Tests, the engineering work, which is known as the Highway Division, and the economic, statistical, road management, and miscellaneous work which is organized as the Division of Road statistical.

Management.
As the Division of Teeds, which may be regarded
as a National Good Roads Laboratory, is considered
to be the most completely equipped read material
laboratory in the world we give the following detailed description of the plant and work: The Assist
ant Director and Chemist has charge of the Division
of Teels in the has as has sealistant a testing engineer
and an assistant chemist. The chemical laboratory
is under the immediated dreve tion of the assistant emist and the physical testing of materials is under chemist and the physical testing of materials is undar the testing engineer. There is also in the Division of Tests a petrographic laboratory with a petrographer in charge. The routine testing of ma-terials conducted by the Division of

Tests consists of microscopic and chemi est analyses of specimens to de their mineral composition and proper their mineral composition and proper classification, and physical tests to deter-nine their comenting value hardness, toughness, resistance to wear, water absorption, and density (Builetin 79 Bu reau of Chemistry i

in addition to the roulino tests spe in addition to the rounds teem appeared to the collasticules are made regarding the use and composition of asphalts, oils, tars, compounds various emulsions, and sait solutions, with the view of preventing dust and preserving road surfaces (Butictla Nu 34) Other investigations in clude research into the decomposition of rock nowders (Bulletin No. 28 Circular No 38 and Farmers' Bulletin No 239, Circular No 38 and Farmers' Bulletin No 239), the testing of clays for use in paving brick burnt-clay and sand clay roads (Bulletin No 27 and Farmers Bulletin

No 311), and the corresion of iron cuty rts bridges fence wire t Bulletin No 30 and Farmers' tiu No 2391

sent for the physical testing lab is an follows

Large impact machine for testing paving brick, impact machine for testing bluding power of rock dust, impact machine for testing the toughness of rocks, Olsen testing machine for tensile, cross b ing and compression tests, capacity 2,009 pounds, Richie testing machine for testing tensile cross-bending, and compressive strengths capacity-200,000 pounds, delicate platform scale a, byfamile machine for molding briquoties, torsion balance, abrasion ma rhins for testing resistance to wear of rocks, vacuum pump, dismond saw and grinding laps for making thin rock sections for interescopic examinations, ball mili for grinding rock samples into powder centrifu gal pump, dismond cure drill small rock crusher, grinding disk for testing the hardness of rock sam ples, battery of pebble mills for pulverising rock pow ders. Westinghouse all

compressor, hot air batb, gas furnate, and a cum picto cement testing outfit consisting of a Fairbank a torsion machine, Gil mores needles, standard sleves, hriquette moids, soaking tanks, etc

soaking tanks, etc.
The equipment for the
machine shop where test
ing machines and other
apparaiss are made and
repaired is as follows.
Showd lathe, on gine
lathe, drill press, power
hack axe, prevision lathe,
saw table, mincress triumer.
The chemical laborecessary chemical gapa-

ratory is equipped with the necessary chunical apparatus used in making analyses of rocks (lays cements, and hituminous substances it is provided with compressed air vacuum, gas, hot and cold water steam, and electricity. The petrographic laboratory is provided with a petrographic microscope of the latest Fuess model, which besides the usual attachments is Fuess mode, which besides the usual attachments in provided with a revolving analyzer in the tube to aid in the determination of very low doubly refracting mineral, and a Schwartzman scale for the measure-ment of optical axial angles. The methods used for examining and classifying rocks are fully set forth in Bulletin No 31

The road material laboratory was established in December, 1900 and from that time until November 30th, 1908 3 018 samples of road material nere tested from practically avery State in the Union. The results of tests made up to January 1st, 1908 and a brief description of the present methods of unking routines. tests are shown on Form No. 28

ARRANGEMENT OF STOCKADE AND RAFT WITH WHICH THE LAKEVIEW OUSHER WAS CAPPED

bilis has remained practically nuchanged up to the present time, except that the name of the office was changed from "Public Road inquiries" to the "Office of Public Roads" and a statutory organization was provided in the Agricultural Rill approved March 3rd. provided in the Agricolitaria isini approved Merch 3rd, 1905 in the appropriation bill for 1909, the rent or purchase of road-making machinery was forbidded. The total appropriations to the fixeal year 1909 inclusive amount to \$473,40 The estimate for 1909-10 as approved by the Secretary of Agriculture is for The Office of Public Roads is under the jurisdiction of the Mational Department of Agriculture as shown above. It has no administrative duties and exercises

apore, it can no administrative curies and exercises on control whatever over the reads of the United States, its functions being entirely scientific and educations. No appropriations are made by the national parameters for roads except on government reservations. A the present time there are sixty-even off-

NEW TWO-CYCLE MOTOR'S

DEFECTS OF THE TWO-CYCLE ENGINE AND HOW THEY ARE OVERCOME

A belief is growing among gas engine experts that the greatest improvements in gas and gasoline motors must come in the future from some type of angine which gets increased power from its cylinders eliminating the idle revolution of the four-cycle If is conceded that four-cycle design has practhally reached the limit of its possibilities the advent of the automobile having drawn the services of the brightest men in the gas engine field, the result of whose work is seen to-day in the splendid examples of gas engines found in even the cheaper kind of autoof gas engines found in even the cheaper kind of auto-mobiles. However many designers feel as was er-pressed by one prominent engineer, that "It is incon-civative that the four-stroke cycle with its small ultisation of one-half of the pitton strokes will be accepted as the finality of development, the two-stroke cycle as now applied in country unsatisfying for resonus that are femiliar to all students of the question."

It is apparent that the chief efforts toward improvement are now being made with a view to eliminating the defects heretofore common to the two-cycle type The (hief defects of the usual two-cycle engine may be summed up as follows

i The explosive mixture is taken into the crank case resulting in leakage and in possible explosions

2 The new charge comes into direct contact with 2 The new charge comes into direct contact with the hot burned games, causing possible pre-ignition and some loss of gas at the exhaust
3 The charge is not large enough in volume be cause the crank (age is an altogether inefficient com

pressur on account of its very large clearance. This means a small charge and also a large percentage of

dead gas left in the cylinder

4 The power is not increased materially by the double number of explosions because of the weak

charges and poor economy

Several recent two-cycle engines most these defects several recent two-cycle engines most these detects in different ways. The Newcomb engine was recently exhibited before the Automobile Club of America. This is a two-cycle engine using the crank case to supply alt only. This air blows out the previous charge and hurnlanes oxygen to hurn the next charge of fuel. The fuel is injected directly into the cylinder from a The hin is injected directly into the cylinder from a phinner jump, the quantity being controlled by resu-lating the stroke of the jump. The gastoline is directed downward into a small cup on, the bend of the piston. When the platen rises this cup or pocket is in the vicinity of the gawkr plug so that there is always an ignitiable mixture near the plug even when running on very light lead. This arrangement avoids several on very light load. This arrangement avoids several of the defects of ordinary two-cycle engines. The rharge is limited, however by the amount of air which can be supplied from the crank case, which would scarcely exceed 75 per cent of the displacement. of the piston, leaving the other 25 per cent and the clearance space filled with burnod gas. This engine rearrance space nine win ournou gais "ins cagine will indoubtedly be more powerful, economical, and reliable than the ordinary two-yele motor. Another improved type of two-yele engine is that employing a differential piston. This engine leaves

out the crank case entirely as a means of supplying

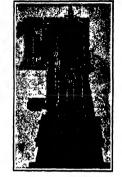

Fig 1.-Shortt two cycle motor.

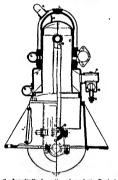

Fig. 2: - Longitudinal section through the Bruderick

the charge or air and compresses the charge philiality an anniar chamber formed by a differential er an anniar chamber formed by a differential er and disnessed piston. Two crytisches are worked seguite the lower piston. Two crytisches are worked seguite the other This permits petting a full charge large capacity, though the loss of fast through large capacity, though the loss of fast through schaust is itlady to be greater. The junkage ions base friag are eliminated. This type of motor is so the Mimore actionable and a tight-weight may weighing but 3½ pounds per horse-power and structed after the design of J W Broderick is to being manufactured for aeroplanes and other secu tic purposes.

A good idea of the method of operation of this m can be had from the diagrams we reproduce cross-section of one of the cylinders shows the is The cross-section of one of the cylinders shows the large compressor plating on the lower end of the working platon O' On the down struke the large platon draw in a charge of gas from the eacherster through the presses this charge in the chamber F show it and in the pipe of leading across to the listed port of the sec-oud cylinder Just before the piston of the second cylinder costs the ashaust port, it uncovers the Inick port O and the charge compressed in the transfer pipe OF I senting from cylinder one to cylinder two, passes into the cylinder and is directed upward by the defie

from mack area in the orank case, which sometimes cause serious damage

The new cycle motor is a recent invention of C A.,
Dawley, member of the American Society of Mechanical Engineers This engine has some feature of both
of those described above it uses a differential pistore of those described above it uses a differential pixton and handles the charge in an annular charaber, but it also compresses air in the crank case. Owing to the enlarged diameter of the piston in the crank case, the air supply is in access of the piston displacement. The are supply is time sceene of the plane displacement. The art displaces the exhant and accurage the rylinder before the new charges is admitted. The admission of the new charge is controlled by the value P in Fig. 5, and the timing is such as to introduce the charge after the cylinder is cleared of borned gases, but before compression commences. This evidently will give a chil charge of all and fice is and prevent any loss of fuel or premature ignition. When used on gasoline this engine may use a carbracter, in which came an entire rich mixture would be drawn into chamber 3, while the additional air required for combustion would come from the trank case. Or a freel pump may be accepted to the charge of the c

A BOUGH AND READY GALVANIC BATTERY.

The best battery for experimental work in the work-The one taking for experimental work in the work-hep or laboratory is one of the rough-and-ready type pat will give a moderate current of stectricity of y three or four amperes with an electromotive force L5 to 3 volts. Such a battery is suited for the exting of a powerful electromagnet, for magnetizing irposes, operating an induction coil, and for electro lver plating, electro brazzling, or slectro coppering giver piating, electro brassing, or steetro coppering either by the hot or cold process, and for electro gild fag. The following description will enable anyone who can bandle woodworking tools to construct such a battery consisting of two cells capable of being coupled so as to give the current of one large cell or In series so as to yield the current of one cell as pa series so as to year as current or one en and the electromotive force of two. This inter plan is the one best suited for coppering, brassing or electronickeling. This type of battery has been used, and is still used by the writer for all the purposes men tioned, for over five years, so it has been put well to

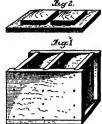

the test of experience

The wood used in making the battery must be ther
oughly well seasoned. An old board that has been kept years he an office or a loft will prove the thing required. The board should be 1 into thick Cut a strip 5 feet long and 8 inches wide. Plane this smooth all over and then cut three pieces 13% inches long, and three pieces 5% inches inog. The inter will form the ends and central division of the bat will form the ends and central division of the bat tery. The side pieces must be growed so as to re-ceive these pieces with a very nice fitting joint as shown in Fig 7. The bottom piece must be made as shown in Fig 7. with two pieces of wood cut exactly 5 inches square, this aise being the inside measure-ment of such cell i These squares must be held in place by means of screen that are inserted from the underside of the bottom board and pecetrate to with 1.2 Lendred the series nursice of the squares. The in % inch of the outer surface of the equares should also be costed with a thick shellar varish (not glue) before being fastened in place. The grooves in the side places and the ends of the division pieces the side pieces and the ends of his division pieces must also be well coates with thick shells, varnish, after which the pieces should be driven tightly to grither and held by nails or acrews. Nails driven disponsity make the best job because they will draw the woodwork together more firmly than screws, and resist direct strain better. The object or using shell

the woodwork together more firmly than serves, and resid direct strain better The object of using shel lac is to haure a perfect scid proof joint, and the f-inch square pieces where presed into position form a bottom so firm that no scid flquid will posentrate When the battery has been put together it must lined on the itsade with a costing of hurning hot pitch. Use and offs surveyant form the pitch in Your some into one of the crist and tilt he battery first one side then another until all four sides have been one side then another until all four sides have been submitted to the hot plich. Pour the pitch back into the saurepan, take a strip of square or flat iron, make and around the joints at the bottom, so as to secure and around the joints at the bottom, so as to secure

brass battery clamps to these with a strip of sheet copper folded over the top of the earton block. This is an Important Item. It use will protect the brass clamp from being corroded by the acids. The sine cylinders can be purchased with a copper strip and binding acrew attached. The sine cylinders must be amanagamated by doping them into suphrute said I part, water 8 parts, and then rubbing atl over inside and outside with quidealiver. Place these sines in the wooden vessel, likely up a mixture of suphrute could be according to the control of the protection of th

A BOLOH AND BEADY GALVANIC BATTERY

sium 12 ounces sulphuric acid half a pint. Allow this also to become cold. The battery is now charged by also to become cold. The battery is now charged by pouring the bifures attentioner into the porous poin, around the carbon blecks and then pouring the still putter acid mitture into the outside space around the sine cylinders. The battery is now restly for any put pose required and will keep in good action for about att bours continuously. When not in use the rime rylinders must be removed and placed into a stone-righter and the removed and placed into a stonecynners must be removed and placed into a atone-ware trock filled with water, and the bit-hromate init-ture must be returned to the vessel it was made in The carbon block can also be stood ou end upon blot ting paper or in a wide mouthed picks bottle. The sail phuric acid mixture can be allowed to remain in the woodon battery cells. For intermittent use such a battery will work well for months and meet every refor small work, either in the workshop or No amount of hard use will injure it, if Inhoratory well put together as described. No acid solutions will affect it, although the liquid may be left in the cells year in and year out

SAPE GASOLINE TANKS

SATE ORDITIE TARKS

To m, r was to me to mixture of gasline vapor with air *accidentaly ignited, of course)

I think the air in a gaudine tank could well by r
placed either by water or a non-addining as such as
carbon clastice, after the manner here illustrated

main or pipe when its pressure of the water forces the
gasoline out through the stopcock B. The valve C prevalus the water from excaping into the gasoline cans
through the stopcock B. To reall the tank, the stopcock

APPARATUS FOR EMPTYING CARROYS

if the liquid in the carboy is sulphuric acid (oil of vitriol) or any other liquid that attacks rubber the two bent tubes connecting bottle to bottle may or mane in one piece and it care is taken to push the each of the tubes below the end of the corks the liquid who t reach up to them and so they will not be hurt in the slightest. In fact no rubber connections may be made use of except from the auxiling pump to one end of the line of bottless though, of A glam filter pump is the heat to use because any

funes that may perhaps come over have no correcting effect on it, as they would have on a metal one

Scientific American

MAKING YOUR OWN PERSURERY.

BY A. S. ATKUM

The manufacture of perfumery has always seemed a difficult process to many, and without doubt the bleading of certain kinds of perfumes in a matter of much scientific and skillful manipulation, but on the much scientific and skillful manipulation, but on the other hand, the most commonly used perfuses can be made at home with simple apparatus and without much expense or trouble. In many parts of the con-try, flowers are so abundant that one can harvest all that are needed for manufacturing at home perfu ugh for a year's use

A perfume garden should prove as profitable as one A perfume garden should prove as profitable as one of fruits or vegitables. We plant gardens for cut flowers and for flower seeds, but flow rates flowers and for flower seeds, but flow rates flowers to perfume making. Enough perfumery is sold in this country annually to make a yearty tax of nearly the oddiars on every famility. This amount is not evenly distributed, but each woman spends enough to make it worth while, if she has the garden space One must devote time to the cultivation of certain

One must devote time to the cultivation of certain flowers which thrive luxuriantly in the vicinity in meny parts of the country roses thrive so luxuriantly that fields can be sown with them, and an abundant crop raised in other sections the rose is too slowcrop raised In other sections the rose is too slow-growing for this purpose, but the violet takes its place Again, it must be the jammine, the tuberose, the orange blossom, or layender. Whatever flower it is that thrives and possesses delicate but powerful fra-grance should be chosen for the work

Direct distillation is the most satisfactory way of taking perfumery. The still is a simple affair and making perfumery. The still is a simple affair and it can be made out of articles found in the average bothe. Take an ordinary tim oil can, scour it, and purify it of all oil dors 8000 the spout completely, and fit a cork in the top through which the oil topoured From a bardware store get four feet of coper ubing (tim or galvanized from pipe may also be used). The time should be both downward at the

The tin can should be filled with a pound of flo

HOME-WADE PERFUME STILL

petals gathered fresh in the early morning Pour over these petals eight fluid ounces of alcohol T the can in a saucepan haif filled with water, as on a stove, where the water can be kept at the boil-ing point. A hole should be cut through the cork of the cen just large enough to receive the metal tube. the can just large enough to receive the metal tube. Place a quart jar on a table nearby, and insert in it the other end of the tubing. This jar should not be sealed, or distillation will not go on properly When the water boils, the alcohol in the can is

heated, and this process extracts the perfume from the flower petals, and gradually causes distillation through the tube into the cold jar on the table. The alcohol thus distilled will carry with it the true attar of tha flowers. Alcohol has a peculiar property of extracting nowers Arcodo mas a pecuniar property for extracting and holding the scent of flowers. As fast as distilla-tion goes on, the contents of the jar should be emptied into glass bottles and securely corked and seeled with parafin in blending perfumes of several flowers, do the mixing after each one has been distilled sepa-

the mixing after each one has been distilled sepa-netty Do not mix the flowers in one still.

Another method of using this still is to employ
Another method of using this still is to employ
after vary cut have essential oil of the flowers, and this
rises and floats on the surface of the water in small
spholler, which must be skitumed off carefully, and
immediately bottled and kept cool and air tight
When samficient oil is obtained, it should be mixed with alcohol to retain the odor indefinitely. One may with alcohol to retain the odor indefinitely. One may distill with water any number of kinds of 50eers, and with the essential oil properly bottled, blended perfumes can then be made. A few drops of several kinds of oil are poured into a bottle containing a certain amount of alcohol, and when shaken thoroughly one amount of alcohol, and when shaken theroughly one has a delicious fragrame for home use. For instance, cau de cologne is made by pouring into a glass bottle a pint of alcohol, and edding haif a drachor of home-mede attar of rosemary and twenty drops each of the attar of orange peel lemon peel, and bergamot peel The distillation of these fruit peels is another desira hie home industry. Out up fresh orange or lemon peel and place if in water in the tin can, and heat as for use in flower leaves. The essential off of fless peels will then be gradually distilled into the other receptacle firm of the globules, and confine in corked bot-

Besides distillation, we have the process of absorp-tion, which anyone can do at home with little trouble and expense. It is slightly more complicated, but it will extract the perturn of more delicate flowers, such as the violets, with greater success. This process consists of covering two large shallow page or soun plates with a layer of melted suct. The layer should be half an inch or more thick. When the fat has hardbe half an inch or more thick. When the fix has hard-nod, gather the violeta, jamine, or toberone fewers, and cover the suset thickly with them Then place one plate over the other, and force down firmly. Wrap the plates tightly in paper, so that the perfume will all be retained in twenty-from hours the saset will have absorbed nearly all the perfume. Then quickly remove the dead potals, and replace with more fresh remove the dead potals, and replace with more fresh Repeat this operation for several days o once Ropeat this operation for several days or swe for a work, so as to secure a strong supply of odors. When compile betain have been robbed of their eder, remove the top lates and cut the such that mail pieces, and drop them has a wide-monthed bottle or the made as quickly as possible, and with least expo-sure to the air. Then close the bottle or jar, and seal with parafilm to make air tight As the seat absorbed the fragrance of the petals, so will the alcohol rob the seat of 11s concentrated extract. Every day the bot-tle should be shaken at 10th, and in a fortaight the bottles and content of the content of the petals of the bottles and content over the petals of the petals of the bottles and content over the petals of the petals of the bottles and content over the petals of the petals of the bottles and content over the petals of the petals of the bottles and content over the petals of the petals of the bottles and content over the petals of the petals of the petals of the petals of the bottles and content over the petals of the p bottles and corked

Besides making the liquid perfumes, one should co sider sachet powders and perfumed pastes. These have their use in every household. A rose paste is made by steeping rose leaves in water, and pounding with a mortar until reduced to a pasts. This macers with a mortar until reduced to a pasta. This mecra-tion should be thorough, and can be done with an ordi-nary rolling plu Now add a drop or two of your bome-made attar of rose, and permit the pasta to dry in an air-dight receptacle. The pasto will grow quite hard, and can then be cut into any shape desired A piece placed in a drawer will secent the place for a long time. If the pieces not in me are kept air-light they will retain fragrance indefinitely, and will always be ready for instant use. Ladd in lines and citotse be ready for instant use. Ladd in lines and citotse ses, they add that subtle fragrance to the fabrics

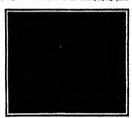

which so many like Sachet powders a which so many like
Sachet powders are as numerous and as varied in
fragrance as colognes. One may compound them out
of fower potals, splots, and partunes to suit individual preferences. The art of making seachat is very
simple and increposative. If we add to these stairs and
essential oils such simple articles purchasable at any
drug store, as ifer root, musik, and crechineal (the last
for coloring only) and and a spless as cloves, claims
moun, and glager, we have all the materials that a mon, and ginger, we have all the materies that a small laboratory requires for making a done kinds of popular wholes. Lavender seeds raised and cured at home side, a sachet situation for those who like this oder Another is manufactured by mixing iris this oder Another is manufactured by mixing iris of crees, the whole moletened with a little alcohel, and then rolled and kneeded into a parts, which in time grows quite stiff A free piscope of this distributed around in the clother press will add a delicious oder to garments. For gifts, appropriate bottles and ribbons or boxes may be purchased cheaply at the store, at the store, and the store will not defined and can be delicious ofter a six and damast can be obtained for concealing suchet or perfumed pastes, and pin cushions may be made and scented indefinitely by inclosing a good place of the perfumed paste in the center

AN EXPERIMENT IN SOURD.

Those who have had the good fortune to travel through a virgin tropical forest could hardly full to have been impressed by the death-like etilizes which have been impressed by the death-like etiliness which perrades all nature between the hours of 1 and 4 P M This is the thermal noon of these regions, when all life, weary with the battle with the terrible heat, seeks repose in a much-needed sleats. No sound is heard save perhaps the elight rusting of a leaf. or the plaintive grunt of a tardogradus as he answe the call of his mate, or reaches out for a new or

leaf with which to satisfy a never-ending appetite Under these circumstances Humboldt, the great G man travaler, who was camping twelve m the falls of the Orinoco River, was astor that no sound from this source reached his set, while sight hours their, during the night, when the weeds were rendered a perfect pandemonium by the spirited war rendered a perfect pandemonium by the spirited partner, stagar, and monkey, the sound of risking waters broke with astendating clearness upin his sur-What ta the explanation of this phenomenon? And why, for example, do the citizens of Weighington has no distinctly, at unjut, the heavy versits, spithery pass over the Fotomar railroad bridge, while starting a claim, examining day they intens in vain for the prime of the manking day they intens in vain for the prime of the noise of the day tradic masks the spended of the war-ten not settled, as althe superheave, of grantfields preven. Some light is thrown upon this problem, by a postpal that no sound from this source reached his sa

of the expedience of the business of the state of the expedience of the periods, there is not a part of the expedience of the periods, there is no the periods of where doep and I mense in manater, instantly yet hear an increase in the intensity of the sound, be-cause the column of air inclosed by such a bottle will wibrate the same number of times per second as the fork. Now hold a second similar bottle between the prongs of the fork, as in the accompanying photo-

AN EXPERIMENT IN SOURS INVERSERABLE

graph, and the sound is practically extinguished, because the creats of the waves entering one bottle coin-cide with the troughs of those entering the other Under these circumstances there is always interference, or allence Now introduce a piece of cardboard between the mouth of the bottle and the vibrating between the mouth of the botts and the vibrating prong, the conditions of interference are destroyed, and houdeses is restored. But an ear cloud is quite as effective as piece of cardiovard Place a burning match or a hot poker buesth the mouth of either one of the bottles, and as the thin layer of warm reaches the opening it acts as a curtain, reflects the sound waves, and instantly the loudence of the other in the condense of wonderful fact, the power of a thin layer of air to reflect sound quite as effectively as a board. Now, what are the physical conditions obtaining during the day between the ears of the citizens of Washington and the bridge over the Potomac Riv shining, the atmosphere is still, a hot stratu snming, the atmosphere is still, a hot stratum of air rises from a metal root, another alightly cooler from a grass plot, another of a different temperature from a concrete street, etc. Many strata of different tem-peratures intervene between the ear and the bridge. peratures intervere between the eir and the briggs, As we have just cheered the effect of one strend, we can readily realist that several would possess the power of complexity extinguishing the agins of the moving trains. At sight, on the confirmy, the sig is homospaneous, the wives sig unimpeded, and strict the current with assembling charmens. Bearing its mind those freat, many approprietly is explicable phenomena become as clear in the monetally

The Latest s fast Freight Engi (Constuded from page 436)

miles. On these divisions there is a heavy movement of freight traffic, con sisting mostly of loaded coal trains. The e conditions on this portion of the grade conditions of this portion of the road are severe and sharp, curves are numerous. Against northbound traffic in which direction practically all the movement of loaded freight trains takes place, there is a six mile grade of 1 to per cent from Carbondale to Forest City From the latter point to Ararat, the sum mit of the rise, a distance of 14 miles mit of the rise, a distance of 14 miles the road is on a grade averaging 0 %1 per cent. Going down the other side of the mountain, it is practically a continu ous grade of 5:17 feet per mile for 7%

miles into Oneonta

Hitherio the freight traffic on this division has been handled by consolidation locomotives, having a theoretical maxi-mum tractive power of 49,690 pounds num tractive power of 49,580 pounds. A single engine of this class can very satisfactorily handle a 2600-ton train from Ararat to Omeonta, but it requires the assistance of two locomotives of the same class, as pushers, to hauf this load up the 20-mile grade to Ararat, at which point the pushers cut loose

with a view to reducing the operating expenses of the division and facilitating the movement of trains, the officials of the Delaware & Hudson Company dethe Disware a Pusson company of ided to investigate the efficiency of the Mailet type iccomplies for this service It was their aim to secure a pusher in more the maximum train load up the more the maximum train load up the bill with two engines instead of bree In the fall of fast year one of the heavy Maille engines built by the American Lao concile Company for the Erical Residual Sub-rowed, and put into pusher service on the 20-mile Arasat Red's A number of test runs were made, which proved that a single Erical Maille Lague could be sub-rowed and work of two Maille Lagues could be sub-rowed and the provided that a single Erical Maille Lagues could did the work of two of their Class E-5 consolidation locomo-tives Following these less the six Mai let engines were ordered from the Ameri can Loromotive Company, and put liste

design, embodying but slight modifica tions from the designs of previous loco-motives of this type of lesser weight, and power constructed by these builders With the boiler pressure of 220 pounds and driving whoels 51 inches in diameter. and criving wosels of inches in diameter, the theoretical maximum fractive power working compound raiculated by the Company's formula which is applicable only to articulated locomotives built by this company, is based on the results ob tained from a large number of indicator ars, taken under various service condi tions, it is found that the tractive power thus calculated represents very accurately the actual power that the locomotive an develop at a piston speed of not

These engines are of a straightforward

over 250 feet per minute With the companys system of compower working compound, can be in treased about 20 per cent by changing the engine into simple. The maximum iractive power of these engines working simple is thus 126 000 pounds

New Two-Cycle Moto

(Continued from page \$44)
compressed air which would then be fur
nished by chamber B to receiver D in is well understood that the high velocity is will understood that the night volucity produced by air under pressure is far more efficient in atomizing liquida than the comparatively low velocity produced by suction. This type of engine aboutd uce twice the power of a four-cycle engine of the same size and speed, and we are informed that tests now being made show this to be the case

Another engine using a differential pis ton but in an entirely different way in the Shortt Motor This engine com-presses air only in the crank case. Un like the others here described it does ot admit this air through a port opened (Concluded on page 450)

American Homes and Gardens FOR JUNE

A Country House, Automobile, Garage and Motor Boat

COMPLETE, FOR \$2,000

COMPLETE, FOR \$2,000

In the June sauce of American Homes and Gardens there will appear, from the pen of the well-known sudher on Furniture, House Furnishing and Decoration, Man Eather Snighton, an article on "How at a Tombie to Obtan a Saul County House or Bungshow," also a Garage of the Naced-down Type, and a Beat House, for the relactionaly small some of \$2,000. That is not all Thoms are produced to the forced-down Type, and a Beat House, for the relactionaly small some of \$2,000. That is not all Thomshowl, with the cost of each article. Would pro believe that the amount named above suckades the entire cost of furnishing? But it also modules the cost of an automobile and of a moter boat! This is no fary tale. The article specifies the cost of the house, the games and the boat house, the cost of the automobile and of a moter boat! This is no fast place! In the supplement of the precision of the precision and the supplement of the article of furnishing, and each pice is illustrated, so that the reader can judge for hisself whether the object he cost of the process for a merupencie can such cost gate, and all to send for No family planning for an inexpensive names or costing should list to send for No family planning for an inexpensive names or costing should list to send for No family planning for an inexpensive names or cost gates and no one is fitted to speak on this subject with greater sutherity than the expert.

This mass contains a large number of other articles on dress subjects, all of interest to the practical mean or woman who is interested in country life in the troubless for 25.5. Subscribes now for the year and recover the thereon suces from June 1, 1910, to July 1, 1911, for the full subscriptors of June 2 year, 33 Address MUNIN & COMPANY, Inc.,

by the piston, but uses instead a valve which is vacuum actuated. The partial vacuum to operate this valve is formed When this platon reaches the bottom of its atroke it uncovers a port Q, through whith air enters and breaks the vacuum, whoreupon the vatve instantly closes. The fuel is fed from a pressure tank through a needle valve, and is deliv-ered at the need of the main inlet valve. As the pressure in this tank is greater than that of the inrushing air from the crank that of the inrushing air from the craik case, it forces the fool into the cylinder against the air pressure. It is claimed that the time the valve is open will vary with the appeal of the engine so as to let in the right amount of feel. The amount of the contract of th wo-cycle motor

Prof S. P Thomas recently stated be fore the Royal Society that he had suc coeded in producing a physiological effec by means of magnetism. A coil of wire was made 9 inches in diame m A coll of ognore 8 inches long, containing 38 turns Through this an alternating current of 50 cycles was presed, with a maximum 50 cycles was passed, with a maximum flow of 180 amperes, giving 5,760 amper-turns. In a dark room, when an observe placed his head in the mouth of the col-le could see a faint binish light, whist was not steady but appeared to fiction considerably. This could be observed

How to Act in Case of Fire. (Concluded from page 441) dredging the part thickly with flour—if the skin is not broken—and not disturb-

ing it for some time.
Any vegetable oil—such as mind Any vegetable oil—such as main, greet, or linesed—may be used with ad-rantage, a rag being soaked with it and ped to cover the wound. A very good spillontion is made by mixing equal series of tinesed oil and time water, form-

gerts of linseed oil and lime water, form-ting "carron oil."

Finally, it cannot be too strongly im-gressed that all clothing covering a burn hust be removed with the utmost care. Never try to withdraw the injured limb, but cut the clothing away-in small pleces, if necessary-so that the injured surface may not be more damaged Never hold a hurn in front of the fire, secording to the popular practice, this only increases the injury Have your oil or other application ready for immediate use as soon as the ciothing has been

Fontracile's Theory of Cometa, The idea of comparing contest to great giass lenses, which concentrate the suns glass lenses, which concontrate the sum a rays into luminous course which appear as the cometa tails, is so natural that its origin cannot be traced it was indi-lated by the philosopher Samea, about the commentement of the Christian era-but it has been abandoned in accordance with the example of Krpler, who after first ambracing this doctrine with after first ambracing this doctrine with enthusiasm, renounced it on discovering that a large comet, which he had occa-sion to observe, possessed a curved tall. The impossibility of explaining this phenomenon, at a time when it was not known that light consumes a measurable lime in traversing interplanetary space caused Kepler to abandon the idea. The celebrated Fontenelle, regardless of this chemical region of stitutions that fock received in the collection, took up and expounded in the objection, took up and expounded in the collection, took up and expounded in the collection of the arguments which may be throught forward in its favor At present, and the coast of every civilized country, phenomena similar to those to which Fontenelle attributed the forms into of the talls of counts, are produced by the lanterns of lighthoness. The dust which is supposed in the attrougher in which is supposed in the attrougher in the coast of every civilized country, phenomena similar to those to which Fontenelle attributed the forms that of the tall and country are produced by the lanterns of lighthoness. The dust by the lanterns of lighthouses. The dissi-which is suspended in the atmosphere is illuminated by the beam of light as fontenells supposed the cosmical dust to be illuminated by the concentrated beam of sunlight behind the lenticular cornet. De Fourviells shows that this theory explains the individual peculiarities of comets, and is confirmed by observations made recently at the Paris and Greenwich observatories. For example, a di ing that the cloud of cosmical dust is not continuous, but intermittent, and the occasional audden appearance of bright fecting body of considerable size, In a word, all the variations which are ob-served in meteoric showers might on this served in meteoric snowers might on the theory be expected to occur in the tails of comets. The evidence of the spectro-scope and the freaks of Morehouse's and Hailey's comets are against this lenticular

Engineers of the United States Go Engineers of the United States Geo-logical Survey estimate the annual dam-ses by floods in the United States at 156,000,000. WHAT WILL THE BAISING OF THE "MAINE" DISCLOSE 1

il E action of Congress in passing a hill mak ink action of Congress in passing a hill max-ing a preliminary appropriation for the work of roising the week of the Maine" is, for several reasons highly commendable. Chief among these is the opportunity which will be afforded to give descut burial in the national cemetery at Arito the bodies of the unfortunate men, who wer carried down in the wreck of the ship, and have re a sined entombed for the past twelve years. Look at it whatever way we will the fact that no effort has it whatever way we will the fact link in offort has been made to recover these bodies carries with it a serialn unconfortable aspect of neglect, and the ma-liun owes it to the memory of the dead, to the sensi-hilities of their surviving relatives, and lastly to its own dignity and self respect, to recover what may b give them desent interment with proper military

Second only in importance to the above considers Second only in importance to the above considers thous are those which affect the scalabilities, and particularly the sense of honor, of a European power with whom we are at present and hope ever to be, on terms of friendly understanding for it is a fact that terms of friendly understanding for it is a fact that the Spanish government fit two yeardy the implication that the destruction of the "Matine" was brought into that the destruction of the "Matine" was brought though not expressed, at it necessity followed from the finding of our Naval leared of Inquiry, which conclude that the Matine was descriped not from within, but from without in the opinion of the Court, again the report, 'this effect could have been produced only by the XIJOsloin of a nife situated under the control of the All of the situation of the court of the the port side of the ship

on the port side of the snip Non, although our Navy Department did not then and does not now, believe that the Spanish officials were in any way concerned in the disaster, attributing the explosion to the haired of fanatics it is doubt ful if this opinion was shared, or is even yet held, by the majority of people in the inlied States Therefore the raising of the "Maine will be well worth alt the trouble and cost it will entail, if the thorough physical examination of the wreck which can then be made, brings to light clear evidence that the explosion was due to internal causes, that is to say, in the spontaneous and therefore accidental comsay, to the apontaneous and therefore accidental com-hustion of the explosive contained in the forward magnetines. This latter was the explanation offered by the Spanish Naval Board which examined the wrek in the line of the disaster, and it is significant that it received eredence not only among naval experts abrond, and especially those of England, whose atti-tude was confedly friendly at the time but size nail percentage of the officers

ON II DELY uld be a "cousummation descutly to wished if the raising of the wreck should afford am ple evidence or even a strong presumption, that the 'Maine' was wrecked by apontaneous explosion in the magazines. Such a conclusion would cast no discredit whatever upon the officers and men who had charge of the "Maine" on that fatal night, for it is well under-stood and tas been proved by accidents such as that which occurred on the French battleshin "Jens that under the conditions in which powder was stored at that period and for some years later it was possible for spontaneous combustion to have taken place in spite of that strict observance of regulations, which nce before the Board showed to have been followed on the "Maine

Now, if this occurred, the tearing asunder of the steetive deck and the blowing out of the sides of

the vessel, accompanied by the instant flood portion of the ship forward of the explosion, would have caused the weight of the ram bow, the amohors and anchor chains, to bend the forward portion downward until the ram was hanging vertically below the ward until the rains was nanging vertically below the ship, held thereto only by the floor and keel plates. Then, as the main portion of the ship filled and sank, the bottom of the ship would naturally be folded down vertically against lited; leaving the keel and the don blo bottom in that peculiar, inverted V position, which

blo bottom is that peruliar, inverted V position, which gives it the appearance of haring been blown up by some powerful force arting from below. When the cofferdam has been built-entirely around the wreck and the water pumped out, it will be possible, in all probability, by a careful examination of the wrecked structure, to determine how far this theory is correct. If it he proved three will be eause for an evaluation of the work of the control of the proved three will be eause for an evaluation. ferred to the category of unpreventable arcidents, a proud nation with whom we are in friendly relation-ship will be vindicated from a charge which even tois a source of resentment that is none the less real because it is mexpressed

REVIVAL OF THE ROTARY ENGINE.

N the introductory article of a series desling with the rotary engine which was published in the year 1897 in the Sevience tvol zilli, Nos 1109, 1110 11iti, we said "The constant failure that has attended the efforts to produce a successful tolary engine, and the fact that the direct acting tolary engine, and the fact that the direct acting rank and rod, re-iprocating engine has retained full possession of the field, have led many people to sup-pose that the rotary engine inventor is as 41sionary a dreamer as the would be inventor of perpetual mo-tion. As a matter of fact, however, many of the ob-jects aimed at in the first dovice are as legitimate pers aimed at these of the latter are absurd and im-and useful as those of the latter are absurd and im-possible. Wille the supposed advantages of a rotary engine as outlined below, have proved very attract tive to the inventor, the results of careful compara tive to the inventor, the results of tarviji compara-tive tests have shown that except in the case of ro-iary impact engines or steam turbines, the rotary on gine does not compare in efficiency with the ordinary reciprocating type. Now it would certainly seem that with nuch theoretical and practical mechaniseem that with nucl theoretical and practical insertant-cal featured in its favor, the rotary engine would prove a formidable rival to the standard type. But this it has mover done, and for the very practical rea-son that owing to its peculiarities of construction, it is difficult to secure an economical regulation of the steam supply, and it is impossible to keep the joints steam tight and prevent Irregular wear of the parts The wear of the piston is always greatest at the dramference of the crimder, decreasing toward the cen ter, and this structural defect has thus far haffled the efforts of the mechanic. The packing decites that bear against-the circumference of the cylinder, like the idaion has of a vertical direct sting engine ingenuity has yet succeeded in compensating the variable wear of the side packing. There is a further difficulty in the fact that in rotary engines that have only one admission port the steam pressure pr a rapid side wear on the shaft, and renders it diffi a rapic side wear on the shant, and renders it dim cult to keep the sluming hox steam tight. Another dim culty is experienced with the value gear, which in the great majority of rotary engines is of the reciprogreat majority of rotary engines is or no recupro-caling type Reciprocations which would involve no serious wear at a moderate speed become serious at the enormous speed of the rotary engine, and produce rapid wear of the paris."

raids wear or the parts
Such was the situation in the rotary engine field
about a dozen years ago. The difficulties were of a
purel; mechanical kind, for the theoretical advantages of the type were highly attractive and never disiages of the type were highly attractive and never dis-puted we remember asking the late George M Hop-kins, a mechanical engineer of exceptional construct-tive ability, who had devoted a large amount of effort to the problem what he thought were the prospects to the property what he thought were the prospects for the production of a successful motor of this type lie expressed the opinion that the large ateam leakness, due to the impossibility of making successful frictional joints coupled with the heav frictional losses, to say nothing of the rapid wearing out of the

the state of the s

shop duty, say in, and day out, by a primary mouth, without shydring may span of and Returnage to make here to the secondary of the superior special property of the superior of an Humann tantitud, with the third that the superior of an Humann at the controlled the respectation, on a tudy of the drawnings description, that access has been achieved by an ing those very conditions of a mechanical may which the experimental work of the past hundy years had shown to be essential to a vetary cash. The tests at the terms in the superior test of the superior test of the same than the superior test of the superior test of the same than the superior test of the same t years has show to be essential in a rotary day.

The tests at Sevena Institute and at the contract plant speak for themselves. It remains for the for the to delermine how far the rotary will succeed in new Seld of high-pressure, superheated steam, which, theoretically, it would seem to be admiradapted.

Tout 2.

THE COVERNMENT AND THE INVESTOR.

HE Committee on Patenta has under consider tion a hill introduced by Mr Currier, purpose of which is to enlarge the juri tion of the Court of Claims so that the Co may entertain suits against the United States for the infringement or unauthorised use of a patented in-tion in certain cases, and award reasonable compet tion to the patentee

sure is necessary, when it is consi The measure is necessary, when it is considered that under the English common law, which prevails in this country as well as in England, a sovereign power cannot be sued without its own consont. The Unitsel States has established a regular tribunal, and charged

States has cetablished a regular tribunal, and charged in with the duty of adjusting claims against the generament but the scope of its duties does not include the adjudication of an inventor's rights when his invention has been appropriated by his government. When the government issues a painni, it does not grant a fevor to the inventor, but it "secure him a right," in the anagemy of the Court in U.S. v. Paimer (123 U.S. 271), and this securing of a right by no penaltic implication certries with it the opposite however the control of the c possinis implication carries with it has opposite power of destroying the right in whole or in part by appropriating it to the purposes of government without complying with that other condition of the Constitution, the making of "just compensation"

For all that many inventors have spent years of

For all that many inventors have spent years of their lives and purcleally bankrupted themselves in developing inventions primarily of use to the govern-ment only to find in the end that their property has been practically confiscated that they have no legal use not preferred, and that the governmental depart meets will not recognize the decisions of the courts to doubt the government has the right to appropri ale an invention necessary for the preservation of the militarial defense, yet appropriate has been based.

it would seem that some compensation should be paid Despite the decisions of the Supreme Court, despite the fifth amendment to the Constitution, which provides that no private property shall be taken for public use without compensation the government again lle use without compensation the government again and sgain sairse private property, in the form of patent rights, without compensation. The Court of Claims now has no jurisdiction to award compensation for the governmental use of a patent, except when such use is under a contract. To extend the jurisdic-tion of the Court so that it may entertain suits and award compensation to the owners of patents in cases where the use of the invention by the United States government is unanthorised, is the purpose of Mr Currier's bill

A similar measure was introduced by Congr A similar measure was introduced by Congressman Daisell in the closing days of the last Congress. The measure passed both the House and the Benate but it was not signed by the President. Mr Currier's hill is practically the same as Mr Dalzelfa with the exception that certain patents taken out by government officers or employees, which are good against all the world, are not good against the government. This is worto, are not good against toe government. This is an it should be; for whon a government Gloer is as-signed to the task of devising an implement, and the government bears the expense incidental to the inven-tion, and the officer continues to draw his salary in the meantime, it is evident that the government is the implied owner or at least licensee of the invention.

The experimental resistances fate the effect of elective property of the prope The experimental researches into the effect of ele

PHOINTERING.

- In is claimed by the contractors that a new record for Arberican shaft sinking has been accomplished on the Moodna siphon of the New York city Catalilli aqueditot, where a shaft 16 feet 5 inches in diameter was sunk 177 feet in thirty-one days. The work was done in hard Hudson River shale
- In a recent government test over the measured mile course off Rockland, the new battleship "Michi-gan" covered the fastest mile out of twenty successive runs at a speed of 1954 knots, which exceeds by Smore than half a knot the fastest mile made at the builders' acceptance standardisation trial.

The first of three concrete barges which will be used the hydraulic operation at the Panama Canal was the hydraulic operation at the Panama Canal was rjeestly isunched. It draws when complete with redging pump, motor, and equipment, three feet nine liches Ons-quarter-inch No 12 wire mesh has been ined in the wall construction. This behavior of these larges will be watched with great interest

The Interstate Commerce Commission has recently guied that, hereafter, on several railways in the North-west, the upper berths in Pullman steeping cars are west, the upper berths in Fillman sleeping cars are to cost less than the lower berths The Commission states that, in the past eleven years, the Pullman com pany has doubled its capitalisation and dividends without the investment of any new capital

The latest report of work on the New York State barge canal shows that this great undertaking is being pushed through with dispatch. At the present , 322.6 miles of the total work is under co additional plans have been completed for 482 miles, and the plans for another 264 miles are ovar seventyave per cent completed, leaving 64 miles, the plans of h are in progress.

With a view to determining whether or not the n type of shells will be deflected when striking at an angla, or whether they will bite into the plate, several of the new soft nosed naval shells were fired from a of the new soft nosed naval shells were fired from a 11-linch gun at the old ram "Kataddin," which was strickan from the navy list, and consigned to the scrap heap in July of last year. The hull was pro-tected by the latest 12-inch armor plate, in sections arranged on the vessel at various angles

An eyabar mada by the American Vanadium Co pany was recently tested to destruction by the American Bridge Company The test bars, which were of vanadium nickel steel, measured 14 inches by 2 inches by 35 feet. The results showed an elastic limit of 80,840 pounds, and a tensile strength of 99,890 pounds per square inch, with an elongation of 335 per cent in 13 inches, and a reduction in area at fracture of 533 per cent Part of the bar was bent cold under a 14,000-ton press, and flattened upon itself without sign of fracture fibouid tha matter of price not provs an acis, this will be an ideal material for th of long-span bridges.

Efficiency tests are conducted by officials of the Pennsylvania Railroad, who, at unusual times and places, sot signals of caution or danger, display fusees, does on the track, with ce torpe all employees constantly on the alert for signals. During the tests for 1909, the following records were made by the men Block signal rules, 47,384, of which 89 6 per cent showed perfect observance on the part of the employees, 45.887 tests of rules governing flag men, use of fusees, torpedoes, and other signals, 99 6 per cent perfect. Altogether, some 300,000 efficiency ed a practically perfect record for the employees.

Acting in accordance with the Spooner act of June 28th, 1905, which states that "the President shall cause to be constructed such agis and commodious harbors at the termini of the Pausma Canal, and make such provisions for their defense, as may be necessary for the agisty and protection of said canals and harbors," ident Taft has saked for an appropriation of \$4, President Taft has saked for an appropriation or vi-00,000 for the commencement of autitable fortifica-tions. He indorses the report of a special board of edicers of the army and nery, which provides, we un-derstand, for an adequate defines by batteries mount-ing the new 14-inch gum The total cost of the com-pleted fortifications will be about \$15,000,000

A most commendable movement in the auth region of northeastern Pennsylvania is the introduc-tion of mine schools. In former days, the Singilab-speaking and Teutonic races, skilled in mining, presmaling and Toutomir mose, actived in mining, pre-dominated in that district, but both ye work is done by a class of Barropeans whose traditions and exper-sion's have notifient to do with mines. Several of the signing companies have established subsole for the headed of these simplycrose, now of the first of which was 'plast separationed by the Philadelphia & Beauting One and Irok Ochmeny. Mers, in attendance, are signed the september and formanyment employed in the object of the best without. The course, which designs a sublimation page to the process which designs a sublimation page to the process which the contraction of the second page to the contraction of the contraction of the second page to the contraction of the contraction of the second page to the contraction of the second page to the se

Scientific American ELECTRICITY.

done more for the betterment of the race than all the art, all the civilising efforts, all the so-called literature of past ages, for which some respectable people went us to have such an exaggerated reverence"

The thirty-third convention of the National Electric light Association, which met at St. Louis last week, reported a vary prosperous year, in which 5,200 mem bers were added, bringing the total membership up to 5,270 The association began in 1885, with a membership of only 71 There are 820 operating companie represented in the association, and these or per cent of the capitalisation of the electric light indus try in this country

A new form of mercury-rod interrupter has been developed, with the object of producing a sharper break. It consists in covering the mercury with a quanching liquid As the rod is withdrawn from the mercury, a hubble of vapor from the quenching liquid forms on the end of the rod and tends to press the mercury level anddenly downward at the break, thus effecting a more perfect current interruption, even though the rod may rise comparatively slowly from

The New York Legislature has passed the bill which places talegraph and telephons companies of the State places talegraph and telephone companies of the State under the supervision of the Public Service Commis-sion for the second district. The bill empowers the Commission to investigate and regulate the rates and service. The companies are required to fits annual reports, and the Commission may vote any priva-gunder the franchises of the companies which have not as yet been exercised. Reduced rates, passes, or franks for the transmission of messages are problibited

A novel ventliating system has recently been de veloped, which consists of a small electric fan con veloped, which constain of a small ciertic fan con-nected to the window still as seed manner that it may be operated either to draw in air from the outside or to exhaust the sit from a room. It is suggested that the value of this will be appreciated in a kitchen on ironing day, or when any baking is being done, as it prevents the heat from spreading through the entire house, busides making the kitchen itself more com-

In order to determine the heat generated by concrete when hardening, aix thermometers of special con crete whan narcening, aix incrementars of special con struction are to be imbedded in the concrete walls of tha Gatun locks of tha Panama Canal Bach thermom-eter consists of an iron cup in which is a resistance coil This is connected by a pair of lead-sheated copper wires to an indicating instrument and a smell storage battery Variations in the temperature of the coil produce variations in the electrical resistance, and this is indicated on the instrument, which is estimated to show degrees of temperature. The instrument ps a continuous record, which should prove of con-trable scientific interest and importance.

It is a difficult matter to measure very high ten sions of electrostatic or Wimshurst machines, owing to the glow discharge which is apt to occur shove 40,000 volts. A new method has been adopted by Prof. C F Guya and Mr A. Tscherniavski, which was re-centry submitted to the French Academy of Sciences This consists in inclosing the spark gap and the ele eter in a substantial box, in which compre trometer in a substantial box, in which compressed gas is introduced According to the Panchen law, the disruptive potential is approximately proportional to the gas pressure. Thus, with a given potential differ-ence, the electrodes of the spark gap can be approached to each other in proportion to the increase of gas pressure, and by this shorter gap the electrostatic effects are reinforced, insuring more accurate readings. his method has been amployed in measuring the ten-ou of a Wimshurst machine, which showed a voitage of 80,000 with a proteing box.

Last November there was a series of heavy snow orms in Germany, which did considerable damage to acoran in Germany, which disconsissensis samage to overshead telephona and teleprophilates As result, a careful investigation was made of the question of putting such lines underground, and it was found that by neing the Pupila system, underground cables could be used to good advantage on lines of iess than 600 miles in length, with wires not more than three millimeters (0 118 inch) in diameter. The advantage millimeters (0.18 inch) in drameter. The auvantages of the underground extern were found to be as follows: That there would be no interruptions due to external causes, that there would be no danger of cross talk, that the efficiency of the line would always be constant, that there would be no interruptions or exconstant, test there would be no interruptions or st peace for resider, due to external censes, and that white juring the cables extra wires could be provided, which would permit of further expansion to most fri-ings denance. It was also shown that telegraph and displaces large could be half in the same cables with-spit diamon, at the could be and the same cables with-spit diamon, at the could be and the same cables with-

Dr William Phipps Blaks, a member of the first
class over graduated from the Shofflad Selentific
School of Yale, side freenity at Berkeley, Calibrai,
shortly after he had received the degree of Li.D from
the University of Culifornia. Prof Blake was
years old. When he graduated from Yale in 1852, he
came the gandegate and miseralization for the University of the Color of the Col tivities included the editing of the Mining Magazine, geological work for the Japanese government, the ploration of a section of Alaska, the teaching of min alogy and geology in the College of California, a ge-logical examination of Santo Domingo, and the teac ing of goology in the liniversity of Artsons

The satisfactory examination of the absorption spectra of glass of various sorts requires, in addition to oplie, a spectrometer with glass or quarts the there s and prisms, and the exact determination of the length of the limit of transparency requires the use of a silt with vary sharp edges a camera with an excellent lens, and a source of light the spectrum of which contains many sharply-defined lines and ex-tends far into the uitra violet. The spectra hitheric employed for this purpose including the spark spec-trum of an alloy of cadmium, zinc, and lead, the spectrum of mercury, obtained by means of the vacu tube or the electric arc, the spectrum of the carbon arc and even that of the Heraeus amsigam lamp (mercury, lead hismuth, sinc, and cadmium), co tain too few lines to give satisfactory results. Zick andrabt has recently employed the arc spectrum of iron, which, because of its extraordinarily large numiron, w ber of times of accurately known wave length, appears well adapted for the study of absorption glass A Zelas spectrometer with quartz ienses and prisms was used. The results, which are published in tabular form, are too complex to be briefly described.

Prof. Haber claims to have solved the problem of troit. Ander taking to have solved the protein of the direct synthesis of ammonia from its elements nitrogen and hydrogen. The process has been purchased by the well known German establishment, the Radische Anilin nnd Soda-Fabrik If the process is as practical and economical as its invontor claims, its as practical and economical as introduction will quickly cause a revolution in a com paratively new but aiready important branch of in dustry, the manufacture of artificial nitrates in sev eral countries possessed of abundant water power, large nitrate factories in which oxygen and nitrogen are combined directly by means of the electric arc, are in operation Prof Haber gives a few details con-cerning his process, but states that the combination cerning his process, our states that the community of hydrogen and nitrogen is effected at a temperature of about 1,000 deg F and a pressure of 200 atmospheres. In a recent lecture he exhibited an experimental apparatus which produced three ounces of pheres. in a recent lecture he exhibited an experi-mental apparatua which produced three ounces of liquid ammonia per hour. The presence of a cata-tyrer is required to accelerate the combination. For this purpose, Prof. Haber employs aranium, but the rarity of this element appears incompatible with its mployment on a commercial scale

employment on a commercial scale.

The adulteration of food in France is said to result in a profit of one hundred million dollars per year.

Bread, which may be called the national food of Frence, he long been adulterated largely with tate, a aubstance which is not only indigestible, but is ex-ceedingly irritating to the gastro-intestinal mucous membrane because of the sharp crystal fragments which it contains. Flour is often mixed with ainm which it contains. Flour is often mixed with amount of water absorbed, with sinc subphate to keep the bread fresh with copper sulphates and ammonium carbonate, to dismissian the quantity of yeast required and temperors has appearance of bread made with spoiled four Denatured sicohol, costing one-sight the price of pure alrohol, to used for the manufacture of the liquours and operation, which are no largely consumed in France Aichold, destarted by the deliction of methyl mixed, mixed with property of the deliction of methyl mixed, mixed with part to the sum and and rain, which have the effect of preclicitation to nme or water and apposed for a two days to the sui-air and rain, which have the effect of precipitating the methyl alcohol so completely that its flavor remains hearly perceptible. The militure is then brought to the desired alcohollo strength by the addition of strong spirits, flavored to suit the tests of the consumer and sharpened by the addition of a pint of nitrie sold to

A COMMERCIAL ROTARY ENGIN

PRACTICAL SOLUTION OF AN AGE-LONG PROBLEM

Elsewhere in this haue we have discussed editorially the problem of the rotary engine and set down the mechanical difficulties which must be mastered before a successful engine of this type can be produced. Reference was made to the fact that a recent rotary engine has undergone a successful laboratory test at the Stevens Institute and a successful commercial test of six months' duration at the plant of a leading test of six months duration at the plant of a leading contractor in this city. This engine, which was de-signed and built by Mr. Gerardus P. Herrick, of 74 Broadway, this tity, forms the subject of the accom-panying illustrations. The principal distinguishing pauring insurations. The principal distinguishing features—those which contribute more than any oth-ers to its success—are, first, the fact that reciprocaling movements are entirely eliminated, all of the movements being rotary and secondly, that the main shaft of the engine runs upon a film of steam, whereby the destructive thrust, transverse to the axis, is completely counterbalanced

MERIANNAL PRATURES rotors or druns of equal diameter, placed one above the other, and running with the barest clearance be-tween their peripheries. By means of external gears, they are caused to rotate in opposite directions at the same speed. The upper drum rotates within a closed cylindrical casing, between the walls of which and itself there is a bare micrometer clearance. The lower, or what we might call the power drum, rotates within a casing of integer dismeter than itself, and it is provided with a rectangular piston which fills the annular space between the external periphery of the dram and the internal periphery of the casing. This drum and its attached piston also rotate within their casing with only a micrometer clearance between the adia with only a micrometer clearance between the adja-cont surfaces. The peripheries of its upper and low-casings intersect each other sufficiently to allow the upper drum to project within the lower casing until it rotates with only the alightest clearance between itself and the power drum

VALVE MECHANISM —Sunk in the upper drum is a transverse, semicircular recess, which serves at once as a pocket to admit the piston of the lower drum as the two drums roll together, and also as an admission valve for the live steam, the proper registering of th valve for the Mvs steam, the proper registering of the piece with this pocket being assured by the fact that the two drums are seawed togethar fitten in admit-table to the steam are simple and easy to under-ther. The attention of the steam are simple and easy to under-stand. As the piston (which, viewed from the side of the engine shown in our drawing, moves opposite to the hands of the clock) clears this pocket in the to the names of the clock) clears the pocket in the upper drum the latter moves forward until its leading edge close closes the steam iniet, when live steam is admitted to the annular space back of the piston and continues to flow therein until the

after edge of the pockat has swung round clear of the steam cylinder This point of cut-off is the popoint of cut-off is the po-sition chosen for the ac-companying illustration. During the rest of the stroke, the steam works expansively, until the after expansively, until the after face of the piston clears the forward edge of the exhaust ports, which are shown in dotted lines at the end of the circu path swept through by the

STAND COUNTERBALANCE The most original and valuable feature of this en valuable reactive of this settled into its the ingenious meth-od by which the heavy load on the main shaft, due to the radial steam pressure in the cylinder, is exactly counterbalanced b) a steam pressure acting in the opposite direction. the roter being balanced accomplished by means of what are known as bai-

ancing piugs, which are inserted in steam balancing chambers. There are two of these plugs, one on each chambers. There are two of these plugs, one on each side of the engine. They are made of sufficient length and diameter to provide an area which, at any part of the strong the search sequal to the area of the sur-face of the drum which is under the presents of the the stemm. For a little over half their peripher, and on the side immediately opposed to that portion of the annular cylinder space upon which the heaviest steam pressure is developed, the belance plugs are provided with a series of recessed steam postests, and steam is admitted to these pockets successively by a series of holes drilled through the drum. Consequent

pournals prevented, but it is possible to thouse the correct on finally addinged half-bearings, whose they is, simply to heave the very less thank to be the correct on the correct on the correct on the correct of the c hrake horse-power en a steam consumption of a pounds per brake herse-power per hour; which peres favorably with the steam consumption e average reciprocating eagine of similar ospecit; will be realised that by getting rid of pucking de and introducing a system of steam balancing and introducing a system or search searcing, are, Harrick has not only prolonged the life of the rotary-sagine, but he has greatly increased its autjust by gui-ting rid of that accumulated friction which, in earlier forms of the rotary, was sufficient to cut down they economy to a point which rendered them comman-cially unserviceable

cally numerricable
Lincontrow Therm—In his report of the laboratory
tests at Stevans Institute, Prof Pryor states that he
obtained the following results With a steam per
sure of 145 pounds and 1,000 revolutions per minute,
of 86 brake borne-power was obtained with satisfact
stans, on a consumption of 50 7 pounds of water per
of 185 pounds of 50 7 pounds of water per
of 185 pounds of 50 8 pounds of 185 pounds
at 1,001 revolutions per minute dawnoped 80 40 brake
borne-power on a communition of 454 pounds of 164 pound an account recontinues per minuta developed 80 46 hrake horse-power on a communition of 44 pounds of water per hour in commenting upon these tests. Prof Pryor says of the engine "lis standiness of operation, its lack of vibration, and its output per cubic root of space occupied, should be particularly communied"

mended". COMMERCIAL TENT—To test its commercial value over a long period of time, the engine was coupled to a dynamo at the Depone Contracting Company's plant in this city, and from August 14th to December 21st., 1909, it served to produce the current for lighting the plant day and hight. It was run for 1,858 hours, or the equivalent of more than six full working months. At the and of this time, it was again tested at the Stevens institute; when, under similar conditions of revolution and steam pressure to those which obtained at the first test, the steam consumption was found to at the first test, one steam consumption was raung to be \$28 pounds, the slight increase being attributed by Prof Pryor to the fact that new ball bearings had been put in without sufficiently careful adjustment, and some rubbing of adjacent surfaces had occurred

FUTURE FIELD OF THE ROTARY —Apart from the field of usefulness open for the rotary because of its compactness, sim-piloity, perfect balance, and moderate steam conwider and more important wider and more important field presented in connec-tion with the steam tar-bins. We have frequestly in this journal drawn at-testion to the fact that the mean turbine is meat efficient in the lower risages of the expansion of clies steam; and this in the higher rannes, bearms of

Farther more, the price at which ears of corn are hold may be a fictitious or a forced one A farmer may take a prize at a fair When the corn is put up at auction, the farmer, having amount as pre-mium for the champion cern, can afford to hid it

GIANT RUHMKORFF COIL

BY JACQUES BOYER

The first induction coil was made by Meason and Referred in 1845, but it was not until 1881 that Rubin the West and the first part in the inductional to definite form, which has not sensibly varied since that time, although it has been improved and modified for various applications. Rchimkord increased the number of turns of wire of the soundary circuit, for which he employed a very fine and very long wire. Perfect insulation was obtained by as at ur a ting the order of the magnetic force a was in creased by inserting a core of parallel from wires inside the consentric coils.

These wires are magnetised by the primary ournetic fux produces currents in

ouf.
The principal improvement in the principal improvement in which have been saide in Rehmberff's original are the following. In the city, increased the person of the heaving in the case of the person of the pe

er This method avoids the production, between two adjacent turns of wire, of a difference of potential sufficiently great to pierce the intervening insula-

tion.
The interrupter, by which the primary circuit is broken at very short faturals, was improved by Ducre-tet, by giving it the form of a vibrating strip of metal, fixed at both ends and bearing at its middle point a

induction cells are usually provided with Poscruit's mercury interrupter, operated by a separate battery of one or two cells.

One of the largest induction cells ever made was constructed long age in England for Spottiswoods, by the instrument maker Apps. Its length was 88 inches, its acturan allmenter, 185, inches, its total weight, 1,4715 pounds, and the weight of its cross of soft from 67 pounds.

consisted of 3,100 feet of wire of a diameter of 1/10 luch. The length of the secondary circuit was 280 circuit was 250 miles. It consist ad of 341850 turns of wire. This apparatus, operated hy 30 Grove cells, produced a spark 40 inches long. A still larger coll was recently constructed in Paris by Carpen

Paris by Carpen tier The second ary circuit of this instrument is composed of 97% wire of a diam eter of 1/125 inch The soft iron core has a length of 80 inches and a sectional area of 9.2 square inches The primary coil contains 792 turns of copper ribbon, about 14 inch broad and 1/25 inch thick arranged in six layers. The coli te engrounded by

FIRE FLORETING WITHOUT FIRE ENGINES.

The practical elimination of the fire angine from fi fighting in the husiness section of lower Manhattan has been brought about by the successful use of the has been brought about by the successful use of the high pressure independent fire service Good results have attended sho this modern magind in Brootlyn, Concy island and Philadelphia, and in all of these piaces independent systems of high-pressure mains supplied from central pumping sations now are sential and established elements in much needed fire The frontispiece of this week's Science MICAN Illustrates the method as by the firemen, and while it is not intended to repre at any particular plant, yet it shows the esset features of a modern high pressure number station otor-driven pumps and the use of the hydrante ong the distribution system, such as are employed in New York city

Now if a pressure of water at the hydrant can be maintained as great as that furnished by the pumps then the latter of course is sup cus. and that, along with adequate water supply, is what, in short, the high pressure system accomplishes.
This condition however, so ancressfully realized, has
been made possible only by modern mechanical and al engineering, to which the firemen have ac by intelligently studying and applying the new re-sources at their command Referring to our illustra-tion, it will be seen that the pumping station has two sets of intakes for its water supply—one for fresh water and tha other, which is in connection with a vacuum pump, for sail water in the case of the New york system, the Croton water is used under all nor-mal conditions, and the mains are kept filled at the ordinary city pressure. The drafts on the city's supply for fire purposes compared with the usual daily consumption are inconsequential, but the river or consumption are management at any time through intakes extanding direct to the pier slips, and is available in case of any failure in the frosh water supply or at a time of a large configuration. For high pressure stations either gas or electric motors are available to stations either gas or electric motors are available to drive the pumps, as there is slways a supply of this kind of power from public service corporations dis-tributed underground, and carefully protocled and du plicated in such a way as to make any possible failure highly improbable Thus in the Manhattan pumping stations the high-efficiency centrifugal pumps are driven by induction motors using alternating current ariven by induction motors using atternating current from the Edison Electric Company, with direct con-nection with its Wateralde station and duplicate con-bection with its sub-stations, provision even being made to connect with Brooklyn in case of emergency A contract between the city and the company requires a constant reservation of power, and the simple of tion of switches puts the machinery into full of tion The centrifugal pump has been found most ad vantageous, particularly with electric motors.

A high pressure system protects a given district here the mains and hydrants have been installed and in the case of New York this territory extends from Chambers to Twenty-third streets, and lies between the Hudson River and the Bowery and Third tween the Hudson River and the Bowery and Third Avenne. The pumping stations are located outside of districts likely to be affected by any possible config-gration, and free from danger from neighboring hulid-ings. They are situated at South and Oliver streets and ings. They are situated at 50 uth and Oliver streets and at Gameroro and West streets. The hydrauts in this system are of the type shown in tha illustration, and are spaced along the mattee at an average interval of 70 feet, and to reach a building on fire in no case would there be required & inentity of hose greater than 450 feet, an important depositeration, as the pressure in a time of hose diminishing supplied to this content

Let us essume that a fire-breaks out in this protected (erritory, and the siarm is transmitted in the usual way, either from a street box of an automatic fire-alarm telegraph to fire headquasters. Thence it is sent out over the fire-alarm circuit of the various fire bouses over the fire-starm circumfagfit the various fire bound in the city including the two high-pressure stations. At these stations night and day there is always an operator on duty who size at, a ladephone switchboard by which the station can be pell in communication not only with the sense of fire but with headquarters and with the other station. Special taisphone in media borean are distributed in close precinity to the byboxes are distributed in close presumity to use ny-drants through the high-pressure district, and con-nect direct to the station, a special service being main-tained by the lelephone company. In front of the operator is a large board containing the numbers and locations of the various starm boxes through district, those to which his own station respo untries, those to which his own station responds the meditately being designated in red The starm comes in over the regular circuit the gong sounds the appro-priate number, which is also registered by perfora-gion on a tape, on which also is printed the time by guent on a same, on which same is printed the time by a clock. If the sizer is one for the station, the opera-tor immediately grasps the lever of the marine tele-graph, and the signals to start are sounded sub-love on the large indicator on the wall. The over spring immediately to their pinces, the whist engineer at the

switchboard and the otlers and machinists at th appointed fations. From the awitchboard everything can be controlled and regulated The current is switched to the motors, and the ponderous pumps are soon revoiring, another switch open electrically-controlled valves regulating the water anpply, while controlled value regulating the water anply, while recording and piles melter and indicators are before the cycle of the calef angular. Not every fire requires the field, of water that can be set in motion from the station, and the standing order is to start one pump, regulating the pressure at the outlet at 126 pounds. The next order must come from the chief of the fire; department at the fire, and may be a call over the telephone to increase both water supply and pressure or an order to shut down the pumps. As shown in the picture, the chief at the fire is even in closer or an order to shut down the pumps. As shows in the apicture, the chief at the fire is aren in doser touch will the pumping station than he could be considered to the could be seen as of activity. The scene within the station when the pumps are in operation is hardy one of extractionary activity. The scene within the station when the pumps are in operation is hardy one of extractionary activity, and no greater cartisates its small fosted than in a well-appointed power plant. The descript control of the chief is no complete that he does not need to learn his position at the switchboard, and with ear open for orders and eye on his meters and unfections, the estire situation is at his command of the chief is sufficient to the control of the chief is sufficient to the control of the chief is sufficient to the chief is sufficient to the chief is sufficient to the chief is sufficient to the chief is sufficient to the chief is sufficient to the procurse of the fire house, from which they followed the engines, to the front and are given they followed the engines, to the front and are given right of way over other apparatus in the streets. When the reliability of the high-pressure service was estabthe reliability of the high-pressure service was setal-ished, for much alarms the engines were not sent out, but held in resgree in the fire houses. In two houses too engines were natively removed and double sec-tion hose companies maintained. As the hose is heavy, the work of carrying and hauling it is par-ticularly ardsous, so that, in this respect, the labor of the firms at the fire has not been lightened by mechanical progress. The automobile hose wagon used by the New York Fire Department, however, has used by the New York Fire Department, however, has demonstrated its complete user/intense for transporting the heavy Sadde of 3 inch home much more rapidly than the transporting the heavy Sadde of 3 inch home much more rapidly than the transporting that the first the first the first the sadde of a fearth connected with tha hydrant outst, of which there are four, and excessate learnish are laid to the serees of action. The former engineer of tha fire engine with his lever key takes his position at the hydrant and witching the takes his position at the hydrant and watching the pressure gaze at the outlet, opens or shuts the valves as ordered. The line is stretched where the exigen-cies of the "a-usion demand, perhaps to the standpipe connections. Thick must be placed at the sidewalk connections, which must be placed at the sidewalk close to the shiding walks, and which connects with the standpipe itself within the building with its out-test and hose resion excel floor. It is this that, affords the fire protection to a skynersper, in addition to the pumping plant of the building, and must be used by the firement or the hither stories, or it may be used to deliver a stream to a fire it an adjoining building. The connection may be made to the sprinker syners or the stream of the halffing hrough as similar outlier to to.

escape, and three fastends or clamped with one of the devices which have been developed for this purpose. Now a single like from one of the purpose. Now a single like from one of the four outsile is practically an powerful as that derived frem a five entire, when it is resulted that these streams can be delivered with a force sufficient to tear off, correlated there, when it is resulted that these streams can be delivered with a force sufficient to tear off, correlated that the streams can be delivered with a force sufficient to tear off, correlated. The New York Fire Department's map of the bid-presenter system has been most successful, and gither on a par with the excellent engineering inserted, and content of the stream of the system on the State Side of the city the distribution mains will be half depict in additional streams on the surject work to be surjected as the stream of the system on the State Side of the city the distribution mains will be half depict in additional stream of the stream of the purples assistes half as the stream of the stream of the purples assistes half as the stream of the stream of the purples assistes half as the stream of the stream of the purples assistes half as the stream of the stream of the purples assistes half as the stream of th ing streets, passing out from the pumping station into two systems of mains, ordinarity operacted but capable of being toolated by the gate valves at the ab-tion and by detract electrically operated, valves, of some point of intermedica. With the Philadelphia spe-

cellar pipe to flood the basement, or, as shown in the

illustration, two lines may be siamesed into the water tower The permanent nextle holders of the hose

tower The permanent nozale holders of the hope wagons may be used, while for a single stream the tripod nozale holders are employed, as that, poperall presents reacher holding he hose aga directlys its practically impossible areas for two or three threeses. The hose may were have to be holsted up note a fire escape, and there featened or clamped with one of the devices which have been developed for this per-

tem, which incidentally uses gas motors and direct acting pumps, in use for a number of years, as which has recently been extended, and with a way which has recently been extenseed, and what is wonly planned project under way in San Francisco, it would seem that the day of the fire engine had peased and that the central fire protection method would some take its place in many other large cities.

Ivas & 1916

A High-Pressure Pire Reduction Valve. Soon after the succes aful inauguration of the high soon area the successful inauguration of the high-pressure fire service in New York city, the Sommerse Amenican's called attention to the need of a suitable regulating valve to be used at the hydrant, in order to render possible the control of the pressure on a eingle line of hose and its adaptation to the work, hand. The need of such a valve has become inciingly apparent

hand. The need of such a valve has become surry largy apparent.

For some purposes, as for a water-tower or stand-pipe of a shyscraper, the highest pressures may be demanded, while for other lines at the same be demanded, while for other lines at the same be developed as the control of the same and indicate the same for the same of the same

has been adopted for suppressive complements such arrivals with a small and compact designed to be transported on the hose tender with the smaller tools, there are two pressure gages, not on the linite dischowing the pressure as the hydrant furnished by the pumps, the other her reduced pressure as the water passes out of the valve into the line. After the hose has the interest with the late valve control to the hydrant with his key wreach, and then he gate valve to the outlet from which the line is taken. The handle of the regulating valve is served down, allowing no valve to passes. A half turn of the down, allowing no valve to passes. A half turn of the water at a pressure approximately of 11 pounds of the passes of the pressure and the pressure of the pressure and the pressure of the pressure and the pressure of the

or hydrant pressure. In short, the pressure on any time from such a varie is entirely under control, and the angineer merely has to watch his page and turn his handle until the desired point is reached when the pressure is maintained automatically in a recent text before the engineers of the New York Department of Water Supply, Gas, and Bilectrically witnessed by the author as the engreementative of the Sirvarray American at the Sir Edwards High Sirvarray Canadarant at the Sir Edwards High Sirvarray Canadarant in Brooklyn. It met every condition Pressure Station in Brooklyn, it met every condition imposed Different pressures from 76 to 300 pounds were put on the mains by the pumps in the adjacent station, and the pressure on the line was reduced as ordered by simply turning the handle of the vature Thus when over 240 pounds was recorded at the hy-Thus when over 240 pounds was recorded at the drant, 40 pounds was dailvered at the nossio 7 adjustment and maintenance of any desired preser were far more easily and satisfactorily controlled it would be possible with a steam fire engina Variation. seure on the mains did not affect sensibly

were an more sainly and assistance or controller may be a simple to the control of the control of the valve while when the line was and the present of the valve while when the line was shirt down at the nostin no effect was manifest.

The valve consists assentially of a valve body, containing a seal, main disk, plane, auxiliary valve; a claphragm, a compression faring, as adjusting sorwer, and claphragm, a compression faring, as adjusting sorwer, a handle, and a small, planed-ported by plane valve. The data and piston are genteroided of one piece, and the portion of the model flaments which the presence passes up over the flatton, which, being of greater diameter than the disk, driven the latter down to its seat, thus shutting off the presence. The next part of the operation is beingfully which the sign presence is endowed by the costing of the gaziliary valve mentiosed above, which being of greater diameter than halp optri through which the sign powerure is conveyed to the top of the presence and the sound as a considered of the control of the gaziliary valve mentioned the sign of the presence of the control of the gaziliary valve mentioned as the reduced presents have been commended as the control of the sautility valve to close, they was present the same as the presence as endowed in the reduced presents have been dealed, as of the presence of the meant large of the presence of the control of the meant large valve also specified to reposted as often as consider they resident with the control of the meant large valve also specified to repost of the meant large valve also specified to require the meant large valve also specified to require the meant large valve also specified to require the meant large valve also specified to require the meant large valve also specified to require the meant large valve also specified to require the meant large valve also specified to require the meant large valve also specified to require the meant large valve also specified to the meant large valve also specified to the speci

Astronomical Photography.

The plan of photographing the entire heavens origi-nated with Monokes in 1887. The death of this emi-nent man of science was one of the advorse factors which have compired to delay the work, which now, however, promises to draw to a triumphant conclu-

The importance of the universal photographic ittal chart to the astronomer of the future cannot be over-estimated. It is now generally acknowledged that the stars are in motion with respect to one another, and our entire soles extreme its motion through some, so that one day the constallations will be seen from a sentility different point of view Changes will see to pass in the apparent arrangement of the stars groups, and in the course of years they will comply, so that semething may ultimately be discovered of the universe it may be that the chart how being perpared will enable the autrenomes of some centurica hance to learn as much of the great universe of stars are we know of our comparatively minute soins a tensor providing within it. chart to the astronomer of the future cannot be over-

man remiring within to the contraction of site years to be the only method of revealing the structure of these scanning to the contraction of the scanning to the contraction of these scanning to formations, the schnine, at all adequately, the star chart on a large scale, though the more present to large because the scanning to the contraction, possesses can incalculable value of itself. The wonderfully accurate price of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of an oscillation in the position of the acts of the surface of the contraction of the tography has be

Scientific American

chart over the elder method of observation is quite chart over the elder method of observation is quite simply explained. The image of a star in the tele-scope is very rarely absolutely steady, for the light, prior to its reaching the instrument, has to pass through the vertinable sea of our own atmosphere, con-stantly disturbed, in practically all portions, by cold Rifle shots are familiar the sert of effect which is thus produced. On a blass plot day, when currents of air are vising road has been been the based ground, the target seems to dance before the beated ground, the target seems to dance before the seven growing talker and shorter and breaking in pieces, with the bail's ays now in one corner and now altogether vanished Something of the same titing happens to the star image when the telescope is set up in any but a very few transgul places, and especially when it is in a country much broken up by monatule chains or arms of the see. On all but two monatule chains or arms of the see On all but two seen dancing and quivering in the telescope, more or less as the str is much disturbed or uniform day when the observer tries to set the spider line of his measuring apparatus upon the image, he has to make measuring apparatus upon the image, he has to make the sort of effect which is thus produced. On a b cessuring apparatus upon the image, he has to make ma sort of estimate of its mean position and set on that. It is really surprising how accurately this upon teat. It is really surprising now accurately this can be done after long experience, but the unstead ness of the object is bound to set a limit to the accuracy which even the most practised observer can obtain. Now it might be thought that this constant vibration of the object would be more fatal to the phohration of the object would be more fatal to the pho-tograph than to visual observation, but this is not the case. For the motion is very rapid, several times a second does the star make a small jump from its mean position and return to it, and, on an average, mean position and return to it, and, on an average, it jumps every way with equal frequency. The con-quence is that the photographic plate, which keeps a record of every jume, produces to the end an limage which is certainly larger than it ought to be, but which is, as a rule, entarged causty in overy direc-tion, so that its center remains still where the center of the image belongs. And whou the plate is put under the microscope of the measuring machine— derive capable of averaged pretermining a fitty thos-derive capable of averaged pretermining a fitty thossandth of an inch—and the threads which are moved by the measuring screw set upon the photographed image, the anlargement of the latter is more than com ated for hy any advantage which accrues from a stondy Image

But the superiority of the astronomical photograph over visual observation is not confined to the star chart Numorous articles in popular periodicals have acquainted the general reader with the wonders of the acquainted the general reader with the wonders of the nebutie as revealed by the photographic plate. The camminative effect of light upon the latter randors it possible to obtain expisite declineations of faintly luminous objects by means of a sufficiently ions cause. Vast hew regions of space are that he large plored, and still waster regions await of "plor axplora tion Prof E Bay Lankster, in an 350res before the British Association, gathed that "the invention of the dry size which he model it possible to another the dry piste, which has made it possible to apply photography to astronomical work is the chief cause of the great expansion of astronomy since 1881. To of the great expansion of astronomy since 1881 To quote Prof Lankester further "It was the dry plate which made long exposure possible, and thus enabled astronomers to obtain regular records of faintly un onus objects, such as solvins such as star spectra. Houghly opacing, those rishle to dept danked eye may be such excepts to 100,000.00 But the number which cappes to 100,000.00 But the number which cap hydrographed is indefinite, and disposite on length of the photographed in indefinite, and disposite on length of the contraction of the contraction of the contraction. photographed is insumine, and upper to be no re-exposure, 100,005,000 can certainly be so re-oprided By the photographic method hundreds of new variable stars and other interesting objects have been variance stars and other interesting objects have been discovered. Naw planets have been detected by the hugdred. Up to 1881, 320 were known During 1881 only one was found, namely, Shophania, being No. 220, discovered on May 19th. Now a score, at least, are discovered every year." overed every year

dishovered every year".

The appearance of Helley's comet this year suggests the fact that some of the most extraordinary revisions of photography in astronous have been into see for these strange nambers of the solar yatem Thy part dies and benuty of consist redest them very liable to flettychances from other celestral bottles. The photographic Blate has shown that the comets next representation of the second of the s this temous body has been photographed.

According to Prof G. W Ritchey, of the Yerkes Ob

seriatory, it is now possible, with the aid of improved of the had metherics, to construct a photographic re-

Secting telescope with as much precision and refinement as have been expended upon the great retracting telescopes. Prof. Ritchey has obtained splendid results from his two-foot photographic reflector, and his photographs thus obtained of the nebule baye a wider appeal than to the scientific mind alone To many a person untrained in astronomical lore, indeed, the pho-tograph of the great spiral nebula in the constellation of Andromeda, obtained with the Yerkes two-foot re of Andromeda, obtained with the verkes two-toot re-flector, would probably appeal at once as that of a most marvelous spectacle—a vast planetary system in the making About the same proportion of the ann to the planets in our own system is to be observed in the great central spherical condensation of the whirling mass and the smaller condensations in the latter of these smaller condansations, at varying distances from the central semi-formed orb, have assumed an almost perfectly spherical shape, others, again, are formless, though vastly denser than the nehulous mat ter extending, in a circular or elliptical form, through out the antiro spiral system It may be observed that the spiral character of this pebuis was never oven sus the spiral character of this nebula was never oven sus-pocted until it was photographed in 1885 by Roberts with a reflecting telescope Yat the result then ob-tained was crude indeed when compared with what was obtained by the instrument at the Yerkes Observaobtained by the instrument at the Yerkes Observa-tory Seen by the naked eye, this great unbuls ap-pears only as an indistinct hazy spot among the stars. The greatest visual telescope in existence fails utterly to reveal the amazing spiral structure so hrilliantly shown in the photograp

shown in the photograph Undering from the results obtained with the two-loot lankrument Prof Ritchey estimates that an eight foot reflector, it used in a climate where there are suitable atmospheric conditions, would photograph stars which are fifty times failnet than the failnet stars which are be seen with the largest modern re-fraction "This mean," says Prof Ritchey are such a reflector sould enable us to posterial seven to the stars which are some the same of the such a reflector sould enable us to posterial seven to the same of the same of the same of the same of the such a reflector sould enable us to posterial seven to the same of same of the same of the same of the same of sam times farther into space than can now be done with times increase into space than can now be done with the greatest visual telescopes, and thorefore that such an instrument would reveal to us a naivorse sevon times soven times sevon—more than three hundred— times greator than the uolverse which is revealed by of no opportunity which has ever been presented to the entire history of astronomy greater than that which now awaits us in the construction of a large modern reflector and its use in astronomical photog-

It is estimated that the cost of such an instrument It is estimated that the cost of such an instrument as Prof Ritchey advocates—that is, one of eight-foot aperture, and embodying the latest developments in optics and mechanics—would be about one-thritieth that of building a batticehip of the 'Dreadnought'

The Current Supplement.

One of the most important articles in the current Supplement, No 1796, is that by George Noumann, in which the compnisory working of German patents is ed, a matter of great importance to American discussed, a matter of great importance to American manufactures. The adhesing of icomolives is a most important factor in designing engines, and must be considered at overy step in the preparation of a gen-eral design. An article on this subject appears in the curront Structurest Ross's excellent description of a profile puppet show, and how it can be made and used, is continued. When abbiquiders common torning out from and steel vessels, navigators found themselves confronted with the problem of overcoming the magnetic forces of their ships and making compass needles point toward the magnetic their compass needles point toward the magneti-north How the problem is solved is told by William C Ward in a paper entitled 'Compass Deviations' Frank C Perkins writes on Canadian pulp making in the Algoria district, Ontario Irish linens and some features of their production are discussed by Sir William Crawford

Three kinds of bench marks were used by the United States Geological Survey in the apirit leveling in Ohio from 1898 to 1908, inclusive, according to a bulletin by Messrs S. S. Gannett and D. H. Baldwin The first form was generally used in the vertical walls of public buildings, bridge shutments or other substantial masonry structures, being a circular bronse or aiuminium tablet, 1% inches in diameter and 14 or aluminium table, 1% inches in diameter and My inch thick, appropriately lettered, and having a 3 inch stem comented into a drilled hole. The sevond form was ompleyed whore massney or rock formation was not accessible, and constant of a holiow wrought trop post, 4 retti ong and 3½ inches in outer diameter, split at the bottom and 3½ inches no as to reasts pulling from expanded to inches so as to reast pulling from the ground—after half-posts were sunk 3 feet in the ground—after half-post were sunk 3 feet in the ground—after half-post were sunk 3 feet in the ground—after half-post was the sunk and the sunk a bean coated with asphalt—and a bronze tanies similar to the one aiready described was then riveted to the top. The third form was little used and is now alto-gather discontinued, being the ordinary split boil of copper, I tech in diameter and 4 inches long

HOW TO ESCAPE FROM A SUNKEN SUBMARINE

METHODS APPROVED AND DISAPPROVED

in a diving manual recently published by Biebe, Gorman & Company, Limited, submarine engineers of London, we find some excellent suggestions on the subject of saving the crews of submarine boats.

subject of saving the lives of a crew of a auto-marine vessel is by no means easy of solution. The equipment and apparatus which is invaluable on ahore to quite useless under water. It would be quite easy to construct a submarine boat, the crew of which ic ontic nuclear under vater. It would be quite cast, on construct a submarine boat, the crew of which would be afte under practically every conceivable set (irrumentaries, but such a vessel would be so ham jerred by her safety devices as to have little or no military efficiency. In the opinion of Mesers Siebe & Gorman It is easential that the salvage of the vessel and of the crew must be looked upon as entirely separate inevitable delays in the sarvivat of the salvage and the crew number of the salvage creation and the crew that the salvage of the vessel is in the salvage of the salvage creation of the salvage of

ilt water comes into contact with the battery or

the sait water comes into with the terminals of the dynamo, if this be still working, chiorine is evolved, and the air remaining inside is vitiated

maining inside is vitiated

If anything is done, it
must be done quickly Accordingly, the following
steps must be taken

(a) To render the crew

(b) To preserve the drowning in crew from

crew from drowning in the boat, and (c) To provide means of escape from the boat, and ascent to the surface The devices to bring these about at present

(1) Air locks for es-

(2) Detachable cham. bers or life boats. (3) Belf-contained dress

Air locks slope are of Air locks sione are of little use except in shal low water, but combined with (3) or (3) are es-septial in all methods of septial in all methods of escape The air lock may be a portion of the boat provided for the special purpose, or the general cavity of the boat may be used in which case the pressure inside the vessel can be made equal to that of the water outside by simply allowing the water to enter for it is mani feetly impossible to open an aperture until the pres-sures at both sides of it are equal. The great ob-jection to all forms of deboats is their size weight. and resistance, if made large enough to contain all the crew of a modern submarine, and as such a submarine, and as such a chamber would have to be carried as a superstruc-ture, it would be in the His-liest position to be injured in case of collision Moreover, what is further against any device of this kind is that the crew are expected in a moment of considerable excitement to undertake an entirely novel operation which there is no means

rm on the left shows a longitudinal section arise, showing an air trap in ose, three men owning-tower that on the right a transverse of a subsaries, showing sir-traps in so in the sir traps, weering sainty-beimets, congright from the continuations.

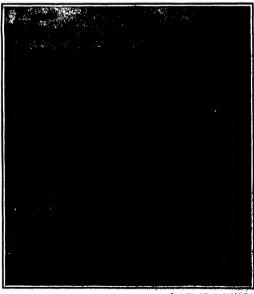

of trying previously Experience has shown that even plain drop asiety weights fall at the critical moment. A life-awing device to be efficient must be able to faith promptly the three conditions, a, b, and c, previously referred to, and is order to meet them a special form of diving heimet has been designed by Messra. Sible & Gornaus which is quite self-contained and not dependent on any feature which is inhie to get out the hand free mevement, is sloped away to fit the shoulders, and is connected to a hort factor of the shoulders, and is connected to a short factor of the prevention of the placks, inside, is a pocket containing a combined as in purifier and organ generator, consisting of two small chambers

formed in one case, These chambers are charged with the patented cubetame which, when in conque with the water vapor of the breath, gives of pure expans patented customs which, when it conque with the water vapor counted abault. ALEXANDER GRAHAM BELL AND THE TELEPHONE

THE STORY OF A GREAT INVENTION

The telephone was first introduced to the public in The sisphone was first introduced to the public in 1876, and put to the first practical or commercial use in 1877. During that year was organized the first sescritation or company to hold the patient. The first companies which systematically exploited the business was tree formed in 1876, one for New England and one for the rest of the l'initial distates and Canada. These two companies succeeded to all the right and property of the original association. The explait represented 1763, one to when the companies were consolidated in the control of the patient, and \$100,000 in cash. Early in 1878 these two companies were consolidated into one company claims or considerations. into one company called The National Bell Telephone Company, the first company to attain any prominence The capital of this company was \$850 000, deposited among \$500 stares of \$100 par velue each. The sum of \$850,000 in sheres wes given, shere for share, for the stock of the two old companies, and \$200 000 in

of 950,000 in shares was given, shere for share, for the stock of the two old companies, and 250 000 in shares was left. In the treasury. This treasury stock was sold for the best price obtainable, as the most was required and yielded eventually \$43,000 in cash for last 100 and 100 and 100 and 100 and 100 and was required and yielded eventually \$43,000 in cash for last 100 and 100 and 100 and 100 and 100 and for last 100 and 100 and 100 and 100 and 100 and for last 100 and 100 and 100 and 100 and 100 and formidable and powerful com-petitor was removed grow the field. Then it was that the stock bosones, The facts in the stock bosones, The facts and 100 and 100 and 100 and 100 and athough that price was probably never actually paid at the highest quotation, a total market value of all the shares of the company would have been \$8,500, ever give the company. Because of the rapid increase in busi-ness, more capital was required, hence of the original in research busi-ness, more capital was required, hence company was organized and the business of the National Bell Telephone Company, transferred to it. The sharebolders of the National Bell Telephone Company, transferred to it. The sharebolders of the National Bell Telephone Company, transferred to the Telephone Company, were given for each stars of their stock-thone Company's slock. At the same

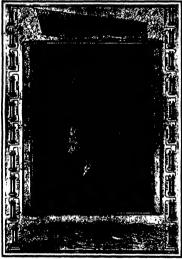

were given for sech share of their stock six shares of the new American Bell Telephone Company's slock At the same time, 8500 shares of the treasury stock were sold at par in 1881 the first degined was paid.

The American Hell Telephone Company continued in business until 1899 during which time the capital stock had

d from \$5 950,000 to \$25,886,300 increased from \$2.950,000 to \$25,885,000 When the American Bell Telephone Company fransferred its business to the Auturican Telephone and Teleprach Company, there had been over \$25,000 on actual cash paid into the treasury of the company by the shareholders as against \$25,885,000 capital outlanding During the time no stock dividend by a dividend of surplus in cash to be for stock leased was paid. The married price of the American Bell Telephone Com-

of the American Bell Telephone Com-pany's share during the year rauged above 8100 e share, and the company was paying; 15 per rout dividends yearly The demands of the business required much larger capital thes could be provided under the corporate powers of the American Bell Telephone can pany Hency, the American Telephone and Telephone

corporate powers of the American Bell Telephone Company Henry, the American Telephone and Telephone approach the tom-distance of the American Telephone and e of the cavities of the mouth. It was not long before he learned that Helmholts had not only made the same discoveries, but had produced the sounds of the vowels by combinations of tuning forks, operated by electro-magnets. In order to repeat Hambolt's ex-periments, Bell began to study electricity In 1872 he constructed an experimental apparatus in which each transmitter consisted of a tuning fork with its prongs between the poles of an electro-magnet. Current was between the pose of an electromagnet. Current was applied intermittently by means of a wire which was attached to one preng of the fork and alternately and and broke the contact with a cup of mercury as the fork wheated. As the prongs of the fork were attracted by the magnet each time the current was ap-plied, the fork was kept continuously whrating and sounding 83 pressing a talegraph key, the intermit-tent current was sure through the line wire to the re-civing instrument, which constitted of another electro-civing instrument, which constitted of another electroceiving instrument, which consisted of another electro-magnet and tuning fork if the receiving fork was exactly in unison with the transmitting fork it was also thrown into vibration, but if it was not in unison it remained stient, because the pertional currents did

ALEXANDER GRAWAM RELL

nkt vacch it with the proper frequency to cause it to vibrate. It was Bell's lice to use several transmitting forks of different pitches, and as many receiving forks of different pitches, and as many receiving forks only the particular receiver that was in unknow with only the particular receiver that was in unknow with a set a simultaneously owner a state plate of a state plate of the state plate not reach it with the proper frequency to cause it to vibrate It was Bell's idea to use several transmitting

current, instead of being intermittent, was undulatorr, varying in intensity and direction in exact scores, as more with the motion of the transmitting read. The two instruments were exactly alles, and either could be used as the transmitter. Several such pairs of first transmitter, Several such pairs of struments, of different pitches, could be employed, with alles wive connecting the two extations, and the pitches liqu of the pitches and the struments of the several sever

in the control of the the instrument, and as he labored to re-move them, it occurred to his that the best form of phonanticgraph would be an imitation of the human ear, in which the sound waves are likewise received by a membrane, the see drum, and the vibra-tions are transmitted to the inner ear by a series of bose levers. Dr Blake, as aurist to whom Bell applied for precise information, concerning the streams of aurist to whom Bell applied for precise information concerning the structure of the ear, suggested the employment of a real human ear instead of an imitation An nantomical specimen was prepared, with a fine straw attached to one of the bone levers to serve as a writing point, and Beil experimented with it in 1874, while be was still working with his reeds and electro-magnets

and electro-magnets

Another possibility had occurred to
him. He knew that when a vowel sound
is sung into an open plane all the strings
that correspond to the overtones, which
give its sound its vowel quality, as well
as the string corresponding to the fundamental tone, are set into vibration, so

arive the sound its rowed quality, as well as suring corresponding to the transmission of the suring corresponding to the transmission of the suring corresponding to the transmission of the suring transmission

MOTION APPARATUS FOR AMATEURS

AN INGENIOUS FRENCH INVENTION

The production of photographs of noving objects has hitherto been desided to anatoms, for various reasons. It requires complicated and costly apparatus and delicate manipulations which cannot be performed without special appliances. Of the control of the contro

small perforations, causes the disk to rotate intermit-tently, pausing after each advance long enough for e single exposure. At the same time the shutter is single exposure. At the same time the abutter is autometically caused to open when the disk slope and to close when it resumes its rotary movement. For the disk containing #4 pictures arranged in a circle, the bearing is fixed at the center of the plateholder, that for the disk with 75 spirally arranged pictures, the bearing is free to move in e vertical silde end, as the responsating pin engages successively with the sol raily arranged perforations, the disk is displaced in such a manour that each picture is meds in its proper piace in the spiral curve. In either case the move-ment of the netherism is automatically arranded when work and essentially similar to the mechanism em-ployed in making the negatives. But, as only a very feeting illusion is thus produced by the disks which contain 84 pictures, there is provided, for these disks ence, another apparatus which can be turned by and, slowly and for an indefinite time, showing the pictures repeatedly in their proper order A third form of agparatus is turnished for the purpose of projecting the pictures on a screen with a lanters

A writer in a contemporary refers to numerous failures of castiron fittings which were, however of the usual run of commercial caira heavy fittings of which meither the metal nor the thickness were sufficiently

ENGINE WITH MEABLESS CYLINDERS. REGIFA WITH CHARLES CTLINDER.

In order to produce a completely-balanced engine, an inventor has recently adopted the unique plan of providing the engine orplinders with two pistons each. The steam enters between the two pistons, separating than This readers the orplinder heads uncleas, for there is no reaction against them. One of the pistons is provided with a bollow piston.

rod to receive the rod of the other piston. The engine shaft is provided with two cranks at is provided with two cranks at right angles to each other, which are respectively connect ed to the two piston rods. Thus a forward and backward impulse is given simultaneously by the is given simultaneously by the steam entering one cylinder, and there is an equal distribution of the load When the pistons reach the end of their stroks, steam is admitted to a second cylinder of the same type, which

steam is admitted to a second cylinder of the aame type, which repeats the operation white the first cylinder exhausts. There are no joils, strains or vibrations, as the forces are entirely absorbed in mo-The ends of the cylinders are preferably closed tion The ends of the cylinders are preversuly cases by multable doors, to prevent dust or other extransous matter from entering and choking or clogging the working parts. These doors are shown open in the accompanying photograph. The model illustrated has wn remarkably high efficiency, and is so perfectly

of the air cushion, and as they are constantly in con tact there is no wear This ingenious little machine tact there is no wear. This ingenious little machine will hime a 16-4op or larger organ silently and with very high efficiency. It requires no sitention, and current sufficient to run the motor is obtained by connection with an electric lamp socket. As it is practically silent and occupies a surface or ninty 51 is inches end in 25 inches to beight, it can be placed on the 500r bedde the instrument. The speed of the motor is constant, but automatic control of the pump ing is provided by a chain connection between the swinging bracket and organ reservoir or believs. By means of this chain the motor and hemisphere may be drawn through an arc of 90 degrees into the position orawn inrough an are of 30 degrees into the position of full organ, while a spiral spring riturns them to the neutral position, as shown in the illustration. The rising and failing of the reservoir thus cause the speed of the belows handle to vary from zero to maximum, and keep the believs full automatically

here and the tire, owing to the clasticity

erewith was The peculiar flying machine illustrated herewith was one of the nevelties at the Clympia Arro Show held recently in London It is the invention of Mesers, recently in London e and Ottine, and consists of a large number of small planes arranged in an endless band and driven somewhat after the manner of a tread nill, the idea being that as these planes move along from one end of the machine to the other at a rapid rate they produce

a lifting effect owing to the slight angle to the heri sontal at which they are set. As they move around at one end in passing from the bottom to the top they one end in passing from the bottom to the tup they are at an angie to the heritostati and still produce a lift, white as they descend at the other and their machine was resulted to the contract of the contr A SEPPENTINE WHARP

One of the longest whereves in the world, almost a mile in length, art to be exect, 4 700 feet is at Port Los Angeles, Cal It extends into the Paulis in a long serpentine curve. The reason for this countries into its that it offers better resistance to the strong currents and the buffetings of the waves than if it currents and the buffetings of the waves than If it were perfectly straight. Until the nearly harbor of Ban I odro was developed by the Foderal government, the big where Angeles was a very busy place, but of late it is comparatively seldom used ux cept by the Japanese Schermen, who have formed a colony atong the adjacent beach

A SERPENTINE WEART MEABLY A MILE IN LEBOTE.

A TRAINIDAD OF MINERS COTTAGRA

issa-to hitchens, and two cars that carry other wreck-age of the coal-mining town of Rock Creek, Taxas, whose mines were abandoned The train was moved successfully at the rate of 15 miles per hour, and around a number of six-degree curves having the outer rail elevated four inches.

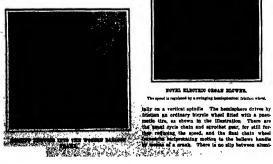

When the Zeppelin balloon was destroyed in a thun-der storm two years ago it was asserted that a static discharge of electricity from the metallic frame of the discharge of electricity from the mechanic frame of social balloon had ignited the gas. To obviate such an acci-dent in the future, a German inventor has devised a balloon having a wooden frame, which he claims is

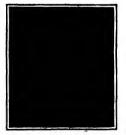

A BALLOON PRANT FORWER OF WOODEN STRIPS.

A SALIGORY PARKY NORTH OF OF WOLLD STATES.

NO only lighter than aliminism, but is stronger as well. A frame thus constructed was exhibited at the result of the production less summer, and proved quiet as attraction. The accompanying photographs show the frame is made up in a network of wooden strips which is very strong and yet possesses a considerable degree of festibility. The model illustrated is 65 fest long and 8 feet in diameter. The meshed the selection of the selection of the selection frame makes a more efficient support for the savelope of the balloon when the gas is standed by the bast of the sum another advantage of the wooden frame makes a more efficient support for the cavelope of the balloon when the gas is standed by the bast of the sum another advantage of the wooden frame is the fact that it can be regalized with possels apparents and by an experienced worknam. The wooden frame is not affected by heat or cold, and may be rendered waterproof by consing it with a suitable varnish.

nother liquor this process the mother liquor this pro-

complicated and expensive The brine is vaporized in graduating works, the output of which depends on the season, the direction and intensity of winds, as well as on the temperature and moisture of the air Each of these graduating works (the total length of each is approximately 25 kilometers) is each is approximately 25 kilonieters) is divided into seven compartments of de-creasing lengths traversed consecutively by the brine, and the sait content in-creasing as each compartment is trav-ersed. After leaving the last comparireed After leaving the last compan-neut the weak solution is from eight to twelve times more concentrated. The bramble walls of the compartments are exposed to the wind. Hence operation of the plant is difficult in variable which On the other hand, the surrounding att with stomized brine, not only makes the graduating works a very cool and pleasant place to stay in on hot days, but at fords a welcome opportunity for utilizing the curnity effects of the refreshing alt alr

sait air.

The pumps of the graduating works are operated by a number of water whele the fed from the river Natie through a system of canals. From the graduating works the brine is pumped through conduits to the reservoirs of the evaporating house, in order there to be holled. Both the evaporating house and graduating works dute from the indelle of the

eighteenth century when the Salines were erected the ancestors of most of the workmen employed therein having spent their lives in the works

The primitive boiling process carried

The primitive boiling process carried out in open sail pairs has recently given way to a modern multiple vacorizer with improved devices for recovering the mother liquor sand the sail it consists of a steam boiler and a number of vapor increase an interpretable of the brine and multipretable of the brine and the b

As the noting of the arms and mather inquer is carried out in women at low tem perature the decomposition of valuable chemical compounds is entirely grevented, thus increasing the curative effects of the products

the products
When the brine has been boiled down
to such concentration as to contain in a
bondred kilogrammes (wenty two kilo
grammes of common sait a supersatu
rated solution is obtained from which the sait crystatizes. As the concentration of the brine increases then increasing amounts of saits are senarated, which imart to the saits an seid taste. These saits re pard for various theremently purposes while the brine left after the separation walls the orne per site of the common sait forms the mather iliquor used for other therapents purposes and of which about 35 until the same produced per annum For shipping great distances, the mother liquor is further concentrated until it crystallizes in

shown that the Kreuznach water con shown that the Kreiznach water con-tains not only pleutifut amounts of gas-eous radioactive emanation but carries along from the intrior of the earth ra-dioactive substances. Part of these sub-stances as the water during the graduair will separate along with iron oxide calcium and barium carbonate while an other part remaining in solution forms to other part remaining tu solution torans in the brine a permanent source of emans tion Experiments made by Eister and Geliel, as well as by Dr K Aschoff, have shown that the residues contain not only considerable traces of radium, but radio lhorium and actinium as well. The mother liquor derived from the Kreuz The nach hrine as well as from the bathing salt was likewise found to be strongly radioactive. Further experiments demon strated the possibility of isolating traces of radium from the residues of concenof radium from the residues or concer-trating the radium salis. As the springs of Kreuznach yield every year radioactive residues by the hundredweight it was desimed advisable to attempt the production of radium saits on a large scale (Concluded on page \$70)

Neumann, Director of to lines undertook experiments according method worked ont by Dr Aschoff of the wings of the bolling house onverted into a radium factory as been operated for over a year entire annual production of active resid ues is now worked into radium salts an end which has made possible an exten sive therapentical use of radium com is, both as a white insoluble pow der of high radioactivity for compr ointments, etc or directly in a dried con dition, and—on a far larger scale—in

An apparatus perfected by Mr Neu-mann renders it possible to determine be amount of emanation imparted to s

ted to water

Mr Neumann has recently worked out Mr Neumann has recently worked out an improved charging method which is especially suited for imparting to any liquids a very intense activity (2000 to 50 000 Mache units) However no de-talls as to this method have as yet been

nads known Satisfactory results have been obtained Satisfactory results have been obtained by treating, by means of charged drink ing or bathing water chronic rheuma-tism of the joints, and gont, while a number of other complaints are favor ahly acted upon

those physicians who have tried the ra-dium-water treatment, is that many pa-tients at the beginning of the rure will show a striking reaction recreaseshes or some symptoms or use promaind, and in some oness in some trou plain in the general condition (insomnia, loss of appetite, etc.) In some cases this manual control of appetite, etc.) reaction manifests itself as a slight feel-ing of interioriton during the bath and

some minutes afterward, while other pa-tients feel especially refreshed and invis-orated. This reaction, which strikingly mbles the reaction produced by many natural bathing and drinking waters,

clusions to be drawn, it doubtless con-atitutes a valuable addition to the pres-ent methods of modern medicine

ALPEAUDER GRAVAW BELL

ALTIANTE CHARM SELL.
(Consissed from page 482)
tha free end of one of his freed to the couter of a membrane capable, like the ear drum of taking up any
kind of vibration. The fixed and of the
reed was not to be clamped but was to
be hinged loosely to the phatring mag
net, as that it would no longer have
any definite rate of vibration but would
follow all the vibrations of the membrane
and the vibrations of the membrane
that the longer have a second or the complex of the country of a receiver But the apparatus was not constructed at that time because Bell doubted whether the currents gene my the action or the voice alone would suffice for practical telephony. Further more, he was induced by his associate to devote his attention to multiple takes

One day in tuning and testing the clamped reeds of his transmitters and re-ceivers he found that the receiving reed ceivers he found that the recalving reed vibrated and sounded when the trans mitting reed of the same pitch was plucked although the battery was not in circuit This discovery convinced him circuit This discovery convinced him that the membrane speaking telephone dovised a year carlier could be made to work

The long and patient researches that followed cannot be here detailed. Mem branes with attached patches of iron and branes with attached patches of iron and sized of various dimensions were tried and the apparatus was varied in many other way. Then it was discovared that a thin abset of iron could be used as the membrane. Thus were developed, successively, the apparatus patanted in 1878, the telephones that created so profound a semantion at the Centennial Exhibition. in the same year the instruments par suted in 1877 and the familiar hand tele phone which with some modification atili universally employed as a telep receiver

at the production of an undulatory cur rent capable of representing all the com ponent harmonic vibrations of voca ponent harmonic vibrations of voc sounds This fact sharply distinguish his invention from the old Reis tel phone which, employing an intermitten current produced by altarnately making and breaking the circuit, reproduced only the pitch of a sound, but not its quality or fimbre and was consequently unable to transmit vocal sounds and artic

aperch

It is safe to say that no patents for
any invention have been subjected to
such long and bitter litigation as the
Bell telephona patents During one of
the many suits which involved the validthe many suits which involved the valid-ity of the patent Mr Bell was on the stand for fifty two days during which time he recited the history of his inven-tion with a clearness and conciseness that still characterise both his writing s (but still characterise both his writings and his specches as we see it today, the tatephone is practically the same in principle and construction as when it left its inventor's hands, so the sai the receiver is conterned from inventions have changed so little. To be sure, the superarrace of the apparatus has been greatly modified. The multiple switch have deal the common hattery system. cult art of telephone engineering has developed But for all that, the phone still remains the same in p

Professor Bell makes no claim to best on ability. He even states that hed is A been for his father-in-law, Mr. Emb (Concluded on since 2004).

Aerial locomotion is another art with
which Professor Bell has become identi His juterest in the subject was ed when, in 1880, he began to make kite-flying experiments, largely for the sake of his health. He started with a Hargrave box kile and eventually devel oped the tetrahedral principle, v open the terraneural principle, which is now well known among aeronauts. Dur-ing the course of his experiments he found that he needed the services of civil and mechanical engineers. Accordingly, a little association was started under the "Aerial Experiment Association." which included among its members the late Lieut, Selfridge, Gienn Curtiss, Buidwin, and McCurdy, all of them now win, and McCurdy, all of them now wen known. Baldwin and McCurdy acted ac-engineers, Curlies was the motor author ity. The association was Mrs Bell's idea, and was founded to carry on Mr Bell's own work. She sold the only piece of property which was here in her own right, and which had not been given to her by Mr Bell, in order to finance the association. Although these engineers were all originally engaged to help Mr Bell in his tetrahedral experiments, the Sell in and tetrahedral experiments, the numbers of the association ended by help-ing one another Selfridge was the first man who profited by the association's assistance. Belleving that it was best to follow in the footsteps of others, and then to improve on their work, he start-ed with gliders, and finally built the "Red Wing," which flew successfully ed with gilders, and finally built the Pad Wing. which few successfully Rest teams Baldwin's chance. He embod-read with the property of the pr

THE REW ERA OF ARROWAUTICS IN AMERICA THE REW EXA OF ARROPAUTIOS IR AREXIOA

Is a curious anomaly that, although America
the birthplace of the practical flying machine
a distinction which is universally admitted a
stands in little danger of future disputation stands in little danger of future disputation— the brither development of the art of flying, as first demonstrated by the Wright brothers, has hithered been confined mainly to Furpeas countries. To us, if has always seemed probable that our apathy was more apparent than real and that when suffi-dent stimulus was offered, the art of a visition was sure to come into its own, and its development be cuted with a scal that was worthy of the energy and liberality of the country in which the first practhal flying machine had its hirth.

Evidently the needed spur has been afforded by the phenomenal achievement of Glenn II Curties in mak phenomenal as literament of Glenn II. Curries in making his recent flight from Albany to New York at the imprecedented speed of over fifty miles an hour —a feat which vindicated both the fracighteness and the liberality of the New York World in offering a prize of \$10.000 for such a flight in connection with the recent Hudson Futton fortival

the recent Husson Futton tratters.

Apart from the fact that so garat a distance was covered at so high a speed there are other considers from which largely account for the powerful hold which this flight has taken upon the public imagina tion, such for instance, as the altogether untried na ture of the course the almost complete absence of suitable landing places, and the absolute composure with which, when an emergency landing had to be with which, which an emergency landing has to be made, the strator circled in his path, awooped down, bird like, upon a small open charing above the rocky and bill-covered cilifs landed, started again on the fluid log of his course above the crowded shipping of the North River, and finally came to rest on Gover-nors laland at the very doors of the honse which was built for him during the Hudson Futton aeronautical Here ween man who at the very first tris and over a course which because of the encompassing mountains and ravines and the resulting air currents was believed to be exceptionally difficult accomplished with evident composure and at times with a sugges-tion of complete sang froid a feat of flying which only six months before, was regarded as a dream of the enthusiast

When the news of his accomplishment was finshed When the news of his accomplishment was finished throughout the country its effect was instantaneous and positively electric. The last doubt as to the prac-ticality of long-distance cross-country flying van labed and the evidence of the awakening was shown ost immediate after of over \$100 and is prizes for flights of a similar character, to be held prires for flights of a similar character, to be neist during the present season to various parts of the United States First came the simultaneous and mu-nificent offers of \$25,000 by the New York Times and the Chicago Evening Post for a Chicago-New York shad the Calrego Swelling took for a three-government of a flight of about 800 miles and of the Yew York World and the 81 Louis Peat Dispatch of \$10,000 for a \$1 Louis-New York racu over a 1000-mile course Then the Washington I C Chamber of Commerce and the Area Club of Washington offered \$20,000 for a 225-mile race from Washington to New York as we go to press a \$10,000 prize is being promoted in St Louis for a flight from that city, over a distance of about 250 miles to Kansas City and \$5,000 is offered to Chicago

are the attractive prises that have been made available, within a week of Cartiss's flight, to promote iong-distance feats of the same character. At the same time, through the liberality of Mr Edwin Gonid, as noted elsewhere in this journal, attention is being directed to the mechanical improvement of the sero

plane itself, with a view to enlarging the ability to pane then; with a view to enlarging the ability to remain continuously in the air and extend the dura-tion of its single flights. The offer of the large sum of \$15,000 for the best successful aeroplane provided

of \$15.000 for the best successful aeroplates provided with two motors, one to be ladd in reserve for emergency, is certain to prove a great attimulate to investigate and contrivations, and should result in the production of some very interesting combinations of motive power. This above related of the past week surely justifies the statement that, when the bittery of the art of frying in America comes to be bittery of the art of frying in America comes to be importance to the statement that, when the wind the statement of the second only in the statement of the statement of the second only in the statement of the second only in the statement of Wright brothers were making their flights above the sand hills of North Carolina in the first practical man-carrying and controllable aeroplane propelled by its

THE PERIL OF THE SUBMARINE. UDGED by the number of tragic disasters which

has overtaken the animarine during the past few years, this greatly dreaded instrument of war might seem to be as great a measee to friend as to fee. In the absence of sccurate ination as to how many lives were accounted for by the anhmarine during the Russo-Japanese war, it is a question whether in the last ten years the sub-marine has not caused the death of a greater number of its own crows than it has of the enemy, ar of its own crows than it has of the soemy, and we instant the statement that considerably over half a hundred lives have been sacrificed during the past no years in the ordinary peace maneuvers of submarine vessels. The long roll of disaster is headed, in point of loss of life by the talking of the Fresch vessels "Pluvines" on May 28th last, off Calsis, when 22 miles and me lost their lives The most taial, 28 officers and men just their lives. The most fatal, as it is the most frequent, cause of accident is colliaion We all remember the running down of a Brit lish submarine off Spithead by an outward bound Ori-ont liner which came up from behind unnoticed, and apparently passed entirely over the aubmarine Within the year a similar accident happened at the entrance to the English Channel, when a large ship ran through a floet of submarines at night time sinking one of the boats. To the same cause was due this recent French dissater, the 'Piuviose' being struck by the paddle-wheel of a Calais Dover passenger steamer

as the latter was leaving Caisia harbor

At the same time, although we deplare the terrible loss of life which has occurred, we must not permit these disasters to shake our faith in the utility of the submarine for the accidents have been chargeable to nummrine for the accidents have been chargeable to inefficient handling, or shall we say to tack of suffi-ciently we experience, rather than to any inherent mechanical defects in the design or construction of ciently whe experience, rather than to any inherent mechanic 2 leftects in the design or construction of the submarine itself. In recent years, outside of those due to collision the iones have been charge able, not to theoretical or mechanical defects in the locat themselves, but to carrieomes or incaprehenes in their manipulation. Teatimony to this effect was afforded by the dilary (an amaning document) which the commander of the Japanese submarine, that was recently annic continued to write up to the very hour of his death, in which with characteristic Japanese modifilty he took he historie for the loss of the very lower of the contractions. of his ceasin, in which with constructed Japanese hobbilly he took lie blame for the loss of the vessel directly upon himself. Mechanically apeaking, the highly-developed submarines of to-day as exemptified in the latest types built for our num navy, are thoroughly reliable. The writer speaks from experience having spent some four hours and traveled some twenty miles under the sea last summer off the point twenty mines under the sea and summer on the point of Cape Cod, in the recently completed "Stingray". The vessel descended, ran on an even keel, rose to the surface and was steered, with absolute precision the air within the submarine was perfectly wholesome and free from odor and the composure of the officers and crew betokened a perfect confidence in the sta-

The disaster to the "Piuviose" proclaims the nec The disaster to the "rutions proteins the necessity for that eternal rigilance which is the pledge of safety in travel not merely beneath the sea but in the air and on the dry land. The charge can be no longer made against the submarine that it is "hillid." In the perfected periscope, the vessel is provided with an eye winner vision is as clear as that of the binorn-iars of a commanding officer on the bridge of a war-Furthermore there has been produce now obtainable a periscope which commands a view of the complete horizon during such time as the subor the complete normon during such that as the va-marine is within, say, ten or litteen feet of the sur-face, and with such an instrument, given clear weather and a careful lookout, the danger of being run over by a ship coming up from babind should be completely eliminated. The actions to the "Pipri-cae" seems, however, to have been due to the submarine rising to the surface just ahead of, and in marine rising to the surface just anean or, and in the path of, the Calais steamer Here is a very real and not easily prevented danger. Although the com-manding officer may take a careful survey of adja-cent waters and note the position of other craft before he diven, much is the speed of medicy; vesself that a city may usuity have peased into some yearing ity by the time this submarine riess signle to the sity, face, even though the period of submersion he lim-ited. Collision on rising to the surface is a form of accretant which for the present, at least, must be reconciled as not accretant execution. regarded as not entirely preventable.

Jones ex sons

"MEGNANIPULATR."

"REMEMBERGE TO BE TO THE PROPERTY OF THE PROPE recognized necessity.

recognized necessity.

It is agreeably to this spirit that we inderse
use of the word "mechanipulate" to designate
bandling of a piece of work by a machine. At present time, all the many elaborate and ingenious operations which are performed by mechanical hands and fingers frequently with a close approximation to the delicacy and dexterity of the movements of the the deliracy and destartly of the movements of the buman hand, have to be designated by the word "ma-nipaties"—which is distinctly a minomer. If the work in question could be assipulated with the same facility, dispatch, and economy with which it is mechanipatised, the mechanical operations would never have been introduced. The credit for the sup-cention of this personal way to the product of the pro-cent of the product of the product of the pro-cent of the product of the product of the pro-Restion of this serviceable word is due to Mr Henry A W Wood, and as far as we know, its first use is to be found in his article on "Modern Stereotypy," in the issue of the SCIPATIFIC ANTRICAN SUPPLEMENT of May 14th, in which, speaking of a plate that has been cast he mays "it is left face up in position to be most easily mechanipulated, position to be most easily mechanipulated, mechanism used for the purpose acting with a gentie, uniform motion to position the matrix with accuracy," etc. Then, in a foot note the writer says. "In my experience, I have frequently fett the need of a word which should express the 'handling' of its work by a machine, as the word 'manipulate' expresses the handling of the work of a man by his hands. To fill the gap I have made bold to coin and use the word 'mechanipulate,' which is here employed ' in hring-ing the suggested word to the stiention of the pubspondence columns of the Scharter American

THE COLDEST REGION OF THE ATMOSPHERE

HE decrease in the temperature of the air with increasing altitude—exemplified in the fact increasing attinge—examplined in the fact that the top of a mountain is colder than its base—is a matter of common knowledge. It is a fact that occasional inversions of this distribution of temperature may occur—as when fruit trees in a valley bottom are nipped by a frost that does not touch tha hilltops but it remains true in general, that the temperature of the air decreases up-ward and that the air at great sittindes is extremely cold as compared with that at the surface of the earth

ntil Telescrenc de Bort announced his discovery of the isothermal layer, eight years ago it was not sus-pected that this decrease of temperature did not ex-tend neward to the limits of the atmosphere. Now. however, we know that at a certain attitude, averaging in middle latitudes, about 11.000 meters (miles), the fail in temperature with increasing attitude ceases rather abruptly, anually giving place to a rise of temperature for a certain distance apward, above which the temperature remains approxim constant as far as the highest ascents of sounding balloons have carried thermometric apparatus

Hance, above any given spot on the earth's surface the air is coldest just below the region of the upper inversion, which marks the beginning of the great isothermal layer (or, as it is now called by its dis coverer, the stratosphere).

The aititude of the isothermal layer varies with the The attitude of the invincement layer rates with the heighteric pressure at the earth's surface with the season, and especially with the latitude. It is somewhat less over the poles than over middle latitudes what less over the poles than over middle intitudes and very much present over equatorial regions than anywhere also in the world. In other words, the dream of the present over the present of the world. The other words, the dream of the present o

This was one of many interesting results of the rerams was one of many interesting reserve or to re-markable series of sounding-balloon ascensions abs-cuted in equatorial Africa by the expedition under Beeon and Ellas, sent out by the Royal Observatory of Lindenberg, the complete report of which has just been published by the observatory.

Toron II, Igra

Concreting in proceeding so satisfactority at the Satus locks had in the upper or lake-level tler, which formed the subject of recent illustrations in our column, about one-half of the work is completed. The grand total of excevation done on the canal during April was 2,632,655 onbio yards.

April was Assisted onto yaros. In a recent paper, Ren-Admiral Bacon of the Britisk navy, discussing the probable battleship of the future, arrives at the conclusion that the race between gun and armor, which has been going on for tween gun and armor, which has been going on for over half a century, has been decided, for the moment, in favor of the gun, nor is there any indication of there being a chance of improving the armor and strengthening general construction, so as to render ships reasonably immune from armor-piercing projec-

The fact that the excavation of the Panama Canal through the Culebra range of hills has set in motion a s of 2,000,000 cubic yards of material, which is sliding into the excavation apparently on an inclined sliding into the excavation apparently on an inclined anhatratum of clay, serves to ilinstrate one of the many advantages of the present high level canal over one at sea level. The sea-level cut would have over one at sea ievel The sea-ievel cut would have been carried eightly feet deeper, and the sildes would have been, in all probability enormonaly greater The material will have to be removed, but outside of the additional expense, no ill effects are to be apprehended

The Budson and Manhattan Raliroad Company is to be congratulated on having introduced some all-stee baggage cars for the transportation of baggage between oaggape care for the transportation of nagage occived the several steam railway terminals served by its system. The sides of the cars are provided with roller curtains. There are also folding aprons, which can be let down to bridge the gap between the loading platform and the car. Eight loaded baggage trucks can be wheeled directly into the cars, an arrangement which eliminates much handling and trucking and fa cilitates quick loading and unloading

The has been determined that the sinking of the United States Souther Grydock "Devey" at Olongapa in the Philippines was due to an omission to close the Intake valves. Accidents of this character occasionally occur, and one is reminded of the sinking of the "Toxas" at the Brooklyn navy yard, which happened shortly before the Spanish American war At the time of her tannching, the "Dewey," 500 feet in length and 135 feet in width, was the largest floating drydock in the world She will probably be raised

Asked for his opinion regarding the probabilities of the introduction in the near future of gas engines as a motive power for driving large steamships, Sir Wilia motive power for driving large scenarios, our win-lam Henry White, for many years chief constructor of the British navy, recently stated that in his opin in the difficulty of high temperatures for the pres-ent effectually barred the way if this problem could be mastered as to its mechanical features, it might be possible to utilize gas engines of 20,000 hours-power; hut the proposals to drive battleships with gas en-gines "are so far only schemes."

The plan for opening a central avenue, one h feet wide, between Fifth and Sixth avenues from th to Fifty ninth streets which is being actively favored by Mayor Gaynor, would undoubtedly relieve the congestion on Fifth Avenue, to say nothing of providing the city with a magnificent thoroughfare through one of its most important districts The esti-mated cost of forty million dollars, however, is prohibitive There are other public improvements, such as subways, municipal hulidings, and public schools that are more urgent than this

An estraordinary record was made at target practice recently by the new battleship "South Carolina," of eight 13-inch guns, which has been in commission only three months. Conswaln J R. Edwards, 21 years old who is in his first entistment, made a record with e 18-inch guns in the vessel's No 4 after turret 16 bull's eye target hits out of 16 shots in 4 minutes and 51 seconds. The hits per gun per minute for the whole 13-inch battery were 101, and 55 of 60 12-inch projectiles hit the buil's eye. Furthermore, three of the four turrets on the ship mads 100 per cent of hits.

the four turreds on the hip mad at 90 per cent of his. The advantages of oil over coat were illustrated in a recent try of the "Tale," one of the 32-host per house staneous which run between New York and Bootton The trights were so matthetery that oil will be used exclusively on these ships to the future. Only the complete he was and count for the complete adoption of ones and count for the complete adoption of the ships to plant the 4,4000 gallact to pump lack the highly signate the 4,4000 gallact will be seen to be completed and the ships to the bound trip. The principal market, amounting to 800° at much a force to the plot that dight opinities of the work in the helper count, when seminating the count of t

ELECTRICITY.

In their tour of the Grast Lakes this month, the members of the Chicago Association of Commerce with be able to keep in telephonic communication with their Chicago offices. Their stammer, the 'Theodorre Concevett,' is fitted with a wiveless telegraph outfit, and also with a telephone system which may be connected with land lines at the docks where the steamer concets with land lines at the docks where the steamer. puts no

The indirect system of illumination, which in casting the light of a jamp against a white surface. such as a ceiling, and having it reflected and diffuse thereby, is rapidly growing in favor. In order to make this system possible with the use of are lamps an improved type of are lamp has been devised by an an improved type of are tamp has been devised by an English cenerar, in which the carbon-feeding mechan iam is placed below the arc. The result is virtually an inverted are lamp, and there is practically no ob-struction to the light passing upward except for the means of auspension from the ceiling

This fall the annual meeting of the Hiuminating Engineering Society is to be held at Johns Hopkins University Arrangements have been made for an exengineering, immediately after the conven six lectures will be given from October 26th to Naveni ber 8th, and facilities are provided for practical d strations and inhoratory work in connection with the subjects taken up It is hoped that these jectures will result in a course of study in this branch of engineering for undergraduate technical schools. It is realized that there is a scarcity of practical illuminating engineers

In Norway and Sanden the question of hydro-electric generation of power has reclared a great deal of atten-tion from the fact that there are so many rivers in those countries capable of such development Contrary, to the custom in this country it is the practice in Sweden to couple generators directly with allow speed turnines One interesting form of turbine generator consists of two whoels, the shaft of one passing through the hollow shaft of the other The wheels turn in opi site directions, and one shaft carries the armature, while the other carries the fields of the generator. This virtually amounts to doubling the speed of the gener-ator or reducing the number of poles. Hydraulic used At Korun are four pairs of turbines on a single shaft developing are rour pairs or turnines on a single shaft developing 420 horse-power The fall is hat six feet and the wheels make but 107 revolutions per minute. At Stangiforden, in Norway, where there is a full of 200 feet, a single wheel is used producing 3 300 horse-nower running at a speed of 300 revolutions per

Mention was recently made of a continued stribe-scope and telephone relay, by which the heart bents of a patient in London could be heard in the Isle of Wight. In a paper read before the liritish Institute of Electrical Engineering, S. G. Brown the inventor a gap of 0 000,000,5 centimeter between platinum elec trodes. The current of a dry cell will flow across this microscopic break, but any elight variations in this microscopic neess, not any eight variations in this distance will vary, greatly, the current passing across the gap The principal difficulty encountered was the question of preserving a gap of such micro-scopic proportions. It was ovidently impossible to scopic proportions. It was evidently impossible to maintain the gap mechanically, but a system has been devised whereby the gap is automatically maintained by the current itself. Despite the dolitacy of the ad justment, the relay may be turned upside down with justment, the relay map of united upone town with out affecting the gap With this relay the fluctua tions in feeble currents may be magnified twenty fold An illustrated description of this relay and stethoscope will be published in next week's issue of the Sonartist AMPRICAN

The wireless telegraph station which has been re-cently erected by the French government on the cently erected by the French government on the Channel coast at Boulogue is of Interest from the fact that it represents the first official application of the Bellini Tool system of directed waves. The new plant at Boulogue is operated by the French Peckal and Telegraph department and is talk out so as to be operated either by the usual method or by the Bellini Tool system. Accordingly the plant has an ordinary vertical antenna and an amported by four-reviews revised antenna and an amported by four-reviews. fron towers 155 feet high placed at the corner of a 260 foot square Four cables connect the tops of the towers, and the Bellini-Tosi antenna consistin the towers, and the Bellink-10ss autenna conventing of two groups of wires, is empended from these Each group is formed of two vartical antenna converging towards the top, each having six parallel wires spaced 12 feet part. These antenna form a triangle with a horizontal section near the ground and two ina mornantas section near toe ground and two in-clined wires. At the top the antenna are 350 feet apart and at the bottom 430 feet. The new skitton is weeking with the French stations of Sainte-Maries, on the Mediterranean coast, and also with the

SCIENCE

Prof. Eduard Friedrich Wilhelm Pfin Prof. Eduard Friedrich Wilhelm Pfueger, who died on March 17th at the age of 81, at the end of over sixty years of single-minded and unawrying devotion student of physiology, was best known to the fic world by the 131 volumes of Phügers scientific Archiv To that mountain publication many a dis-tinguished scientist has contributed Pfüger himself made a special study of the mechanism of spinal action made a special study of the mechanism of spinal action in the frog and the law of reflex action as studied upon the decapitated animal was one of his sartiest investigations. It is work on physiological consump-tion to living organisms has played an important part in our knowledge of the chemical respiration of

During the past three months the United States Wasther Bureau has introduced a simplified form of weather map, known as the 'commercial weather map,' for publication in the daily newspapers, and this now appears regularly in about forty pay. This is an innovation of far reaching importance it gives a much wider circulation to the information contained in the map than it has had heretofore While the matter is still in the experimental stage. It irs altogether probable that the newspaper will ultimately replace the maps now published by Weather Bureau slations throughout the country re suiling in a great saving of expense to the government and the advantage to the public above mentioned

Prof Kronsoher has studied like power of yohim bin to increase the flow of milk of cows and sheep the results prove that the yield of milk is increased during the samulativation of yohimbin, but the in crosso is not sufficient to make an extensive use of yolimbin as a galactogogue commercially profiable in the case of healthy animals. In the case of a cow, whose yield of milk was dininished by an inflamma tion the disease was greatly miligated by the treat uicht, and an increased yield of milk followed. Many similar instances were observed. In no case did any injurious results follow the administration of the No experiments have yet been made on the induction to experiments use yet seen made on the influence of joblimble as a galactopologue in the human species in this case the question of expense is of tess relative importance and the favorable results ob-tained with animals appear to promise a successful

The alloys of Iron with metals other than those which enter late the composition of cast from and steel have been little studied in order to ascertain if any of these altips possess useful electrical proper lies, Burgoss and Anton have made a series of experi ments with alloys of Iron with armeale blamuth, and anilmony The iron which they employed was ob-tained by the electrolysis of very pure Swedish iron The metals were melted together in the electric fur nace in a crucible of magnesia. The alloys were cast into bars which were subjected to various thermal into bars which were subjected to various thermal fratments, and were incredigated for magnetic per meability and hyst reals. The results show that the presence of antimony in Iron always injures the me-chanical strongth of the metal, and sometimes makes Small quantilles of arsenic improve th magnetic properties of from and increase its electrical resistance. Bismuth produces the same effect but it must be added in larger quantities than arsenic

OThe one glows in the Lien cave Sames meaning a the sun enters the sign of Leo, at the sur mer soldier the highest temperature of the year is experienced We may say, on the other hand that the Babylonian astrologers, thousands of years ago placed Babylonian astrologers thomands of years ago placed the king of beauts the fierry and force lous lion in that hart of the zodia, which the sun enters at the sum-mer solutive. The constellation which is called Leo bears very little resemblance to the outline of a lion Probably the name was originally applied only to its principal star, Regulus 11 is to this constellation in the sodiar that we owe the counlies water-gewing floor, heads, which are found in ancient and modern fountains, because in the latter part of July, while the sun is still in the sign lee the Nile is at its highest level Furthermore the liuns nead with bighest level widely open jaws is in itself very suitable for the mouth of a fountain or water spout. This decorative otif was employed universally throughout the tire Roman world Lions heads are found used in this way at Athens Ephesus Olympia Agrigentum, and countless other places. It is not quito certain that this employment of the ilon's head originated in Egypt, Curtius describes an Assyrian has-relief from Egypt, Curtius describes an Assyrian nas-reier from Bairns, showing water streaming from a ring-shaped vessel A lion stands as if on guard on either side of the fountain The water clock, which was need in judicial proceedings, had the form of a lion and a judicial processings, and the form of a non awa as an ame which means the guardian of the stream Hence the idea of protection may have been the origin of the association of lions with fountains, and this outton may have originated in Asia.

THE OCEANOGRAPHIC MUSEUM AT MONACO

BY DR. ALFRED GRADENWITZ

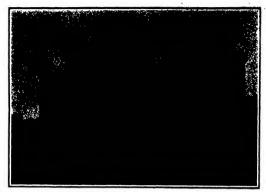

The Prince of Monaco besides being the river of one of the analiset though most charming contribe, note at the end fam. In the world of seleue, has en dowed the principality with a seleutific institute unique in 1st stund, vis, an occanographic masseum festitated to contain not only the cnormous collections rought house from his cowe together of selectivety, but, on realts up acking, everything relating to the investil agation of the sea and its lababilitants, animal and

this museum which was solemnly transpursable soons were songle a situated in a site of surpassing beauty on a precipitous rock dominating the Meditor rareas, close to the framous Ni Meartin Gardenia which will be sometime of the installation of two basement stories, substitution in medically on the installation of two basement stories, which upon immediately on the said for the said for the said for the said for the said for the said for the said for the said for the said for the said for the said for the said for the said for the said said to the said for the said said the more so as some of the pillians start nearly thom, the level of the said.

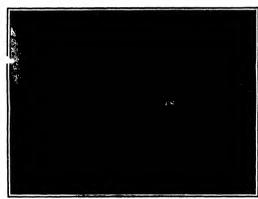

unit, the more so as some of the pillars water bearly from the level of the sea.

The building, 100 meters in length, is of a most imposing superance, and is a manterpiece from an architectural point of view. Each of its emostlish columns & meters in length, is 16 tons in weight Mixt of the motives of devoration are derived from the insuns of the ocean.

When entering the ground floor, we are at first struck by the imposing mosale floor, on which is represented—like who in mosale—the Princeso Alice, the yacht on which the Prince has achieved his most important settnitic cruises. Everywhere ground the hall are seen ornamental subjects representing fishes

The supporting trasses lowered half-way.

THE RIVER NAME OF THE PARTY OF

on abutments constructed on on abulinents constructed on artificial ledges on the walls of the gorge about 60 feet below the railway. The distance between these ubut ments is about 180 feet but the total length of the super structure of the bridge

atructure of the bridge is about 220 feet The supporting trasses were shipped from France is parts small and light change to be carried by non and mules, while the upper trusses, the pylone and the joint connecting the support ing trasses were sent out in riveted sections of compart tively great size and weight which could be transported only by ruli as it was de-algued to have the railway eled to the gorge by H time the construction of the supporting trusses would be

The supporting trusses are attached to their phutments attached to their humm its as they are to each uttur by movable joints. They were assembled in nearly vertical positions and their upper ends were subsequently in ered until they met. Each of the supporting trusses is compused of two single triangular trusses when the property is trusses in compused of two single triangular trusses in the property of the property

nianes of which are inclined symmetrically to the vertical at angles of 14 degrees These trusses are about 25 feet dis tant from each other at their tant from each other at their lower and outer ends and about 11 fect at their upper and inner ends "I is straight bottom chord of each slugle truss is composed of two ver-tical plates about 2/5 inch litck and 14 inches deep separated by an interval of 10 inches suitably connected and stiffened by labors or angle plates The lop chord, which forms a broken line is of similar construction int variable section, and is relu variable section, and in rein forced shows by transverse-nistes about 16 inch thick. The truss is completed by pairs of light L-barr, placed normally and abbliquely to the bottom chord. The two larged truss are connected by tross branes in the planter by tross branes in the planter of the normal barr and in the three planes of the bot

tom and top chords
The lower and outer cuit of each single fruss is supor each single trans it was ported on a stone piler by means of a hall-and socket joint of steel. The concave member of the juint is at tached to the truss the convex member is flited to the pler by means of a bed plate and adjusting wedges. The joint is about 6 inches The upper and inner ends of the trusses are connected in hinge joints having place of forged steel, 76 inches in di ameter. These plass are per pendicular to the planes of the single trusses and conse-quently, are not horizontal quently, are not horizontal but the amplitude of oscilla tion is so small that this slight inclination does not in pair the freedom of the

Although the weight of the bridge is sufficient to insure strongest winds, additional resistance is given by steel

bars attached to masonry anchorages and to the rock.

The superstructure of the bridge is composed of two terminal spans 516 feet and 717 feet le two terminal spans 51 6 feet and 717 roce 1ong, and two intermediate spans sub 45 2 feet in length. The trusses have a uniform depth of about 645 feet. The floor beams which connect the top chords of the two single trusses are 18 inches deep and about 1/3 inch.

The most interesting feature of the Nam-Ti bridge is the method by which it was crected Before the various parts of the supporting trusses had reached various parts of the supporting trusces and various to the tunnel nearest the French possessions a windlass was set up over the mouth of each tunnel and the cables of these windlasses were joined together action together that material suspended from the junction could be tarried across the gorge by unwinding one cable and winding up the other

whilding up the other.

The supporting trusses were partly assembled into a few large sections in the tunnels. These sections were then holsted to their proper places in the trusses. were then holsted to their proper places in the fromes with here exceeded as nearly vertical position and supported by the ball and-socket joints at their lower ends and by temporary siags and timbers. The terminal section of the truss, including the socket, was anothered severely to the rock. The outer balves was anohered severely to the rock. The outer balves for the upper intend with the tiles and brows brites in their common planned, which was anohered severely to the rock. The outer balves in the common planned, which he and brows brites in the common planned, which because against the city and the common planned, which because against the city and the common planned with the common planned to the literator of the tunned by two these attached to the literator of the tunned by two clacking storage request to grow the common planned to the com tackles strong enough to prevent it from being dragged forward by the weight and loverage of the remaining forward by the weight and towerage of the remaining parts as they were added, and to mishifain the com-pleted truss in its vertical position. This frame then served as a scatfold for the assemblage of the bottom chords of the truss and their strachments in this position of the truss the bars which are perpendicular to the bottom thords were so nearly harisontal that they formed convenient supports for the few planks on which the workmen stood. After the bottom of the truss had been completed the inner halves of the top chords were assembled in the same manner some of their auxiliary parts being temporarily omitted in or her auxiliary parts being employing the trues. The parts were temporarily joined by means of lathe-turned boils lo order to secure the greatest possible precision, but the construction of the supporting trueses was so far in advance of that of the railway that it was found possible to replace most of the bolts by rivets before the track had been extended to the gorge Meanwhile in order to save lime, a file of coolies, marching five feet apart, carried through the tortuous mountain passes for more than 12 miles, the

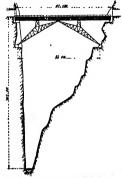

two heavy chains, each 800 feet long, which wore employed in loweriog the supporting trumes to their final positions The other machinery required for this purpose, as well as the sections of the upper table of the upper table or bridge, was brought by

The lowering was ac complished by means of two great pulley blocks, anchored to the face of the cliff above the tunnels and con nected by the two long chains with two simi isr blocks attached to the upper ends of the The chains were first drawn tau In order to slacken the temporary tackles at of the tunnels sud allo their removal The chains were then slowly paid out, by means of windlasses provided with brakes, allowing the two trusses to turn around their outer ends

like the halves of a beanch drawbidge, until their inner ends came to-gather 1n order to facilitate this operation, both trusses carried sights at their inner end, and one of them, which was lowered a little after the other, bore both parts of the hings joints by which the trusses were to be connected. The emitted parts of the trusses were the added, a bed plate was constructed over their junction, and a pytion, which had been partly assembled in frames of two pasts, was structed over the maddle of each truss.

Scientific American

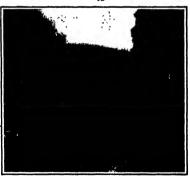

The upper table of the bridge was as mbled, as a continuous trues, in a straight and not very long ex-cavation in the first tunnel. As its construction prossed it was moved forward with the aid of rollers greased it was moved forward with the aid of rollers placed on the two pylons and the junction of the sup-porting trusses until it had been completed and its forward end had reached its abutunent on the oppo-site side of the gorso. The connections between the four spans were then removed. The construction of the bridge was commenced in March, 1908, and was

the experiments independently, and it appears that he has now obtained favorable results, and that sufficient data have been collected to allow of exact calculations data have been collected to allow of extact assessment and estimates being made. The owners of the HO-ganks coal union—the Billishohm Akrishoha,—have in consequence, resolved to bolid a furnesse with a vasacity of 15,000 tons of fine iron over per assum. When this furness has been departed in predetic with the view of discovering possible fashs, the intention is to even this or other furnesses of the name often and Jank 15, 2005

Become Representation of the State The physical interpretation of the sharages profession in the lines of the solar spectrum, by terrestrial weather conditions shall by passing from one to assoches point of the survivide; it, still under disconsists Whitaker returns the state of the state of the state of the state of the state of the state of the state of spectra proteins concurring in the stormy solar atmosphere, nor does be admit that the peculiarities of sparit spectra are characteristics of sizeras sectors of state of spectra proteins of state of spectra proteins of the state of a coil gas, as is proved by the aurors. Whittaker great fributes the observed changes in the spectrum to pre-pressure. Cortic and Brershed, on the other hand, defend the usual interpretation, which attributes the changes to high temperature, radial velocity and chemical action. Evershed does not admit that pres-sures much greater than atmospheric can carist it bas us, even at the bottom of the revereding layer. This opinion is based upon the sharpness of spectral lines in general But the hypothesis implies that in the sun

in general But the hypothesis implies that in the suc gravitation is everywhere opposed by repulsive forces. Until recently the spectro-hellograph was applied images of the flocenii, those bright clouds of calcium images of the flocenii, those bright clouds of calcum vapor which almost cover the sites of the spots and faculs. Since 1908, following the example of Hale, the red line of hydrogen, which shows entirely differ-ent forms, has also been employed. This has led to the discovery of long dark filaments, which normally persist for several weeks, but which sometimes dis-spear or change rapidly near very active spots. Ac cording to Desiandres these filaments represent torus-does with horizontal sxes. They are exhibited espe-cially by the middle part of the line H a, which corresponds to the upper limit of hydrogen vapor marginal portions of the same line show dark fit

hich are reversals of the calcium flocculi The photographs made by Hale, at Mt Wilson, with this same line, show the spots surrounded by cyclonic structures, which exhibit opposite rotations in the north and south hemispheres. These spirsls are far north and south hemispheres These spirals are interest requested to the south of th for of the spots. These phenomena suggest the circulation of electrified matter in a magnetic field. Ever Islion of electrified matter in a magnetic new keys-shed sought further ordineous by pisking the ailt of the spectroscope across a spot near the sun's limb. In this rase radial valorities in opposite directions should be found on opposite sides of the spot. Instead of this, however, Everbad found numerous and persistent indications of a tangential movement, always directed from the centure of the spot. These results were ob-These results were ob from the center of the spot tained chiefly with the lines of iron

of iron Possibly women movements coexist at different levele, tha whiriwinds in a strategy with the st tum of hydrogen, the centrifugal flow in me-

tallic vapors beneath Secchi, who discov-ered that the dark lines of the solar spectrum become bright or reversed in a narrow atra-tum at the base of the chromosphere during a total eclipse, contended that this reversal could be observed at ordinary times Hale and Adams confirmed his view by photographing reversed spectrum
Their success appears to be due to the very delicate adjustments which enabled them to keep the slit of the spectroscope accurately tangent to the sun's limb. The wave lengths of 184 of the lines were red and were found exactly equal to ose of the corre ing dark lines of the

One of the supporting trus

REDUCTION-GRAD TURBING TRATS. To the Editor of the SCIENTIFIC AMER

Your article "A Way Out of the Marine Turbine Hemma," in your issue of the 12th of February places before the general reador throughout the world an epoch-making invantion There can be little doubt as to its great value, and any discussion that h the proof thereof may be welco You refer to the difficulty of ascertaining the actual

horse-power of a turbine as a factor of uncertainty in the calcolation of the efficiency of the combination, at that a reliable theck upon the results given is afforded by computations based on the rise of temperature of the oil But the heat causing this rise of temperature is, at the same time, communicated to the large surrounding masses of metat, and the best thus taken sway from the nil should be calculated, if ossible, or allowed for There is another way less open to question for

There is another way less open to question for measuring the loss of power due to friction. Leight driven shaft be made the driver at 300 revolutions per minute by a reciprocating engine directly coupled thereto, so that the pinion shall be driven. It will then be easy to apply a brake to the pinion shaft, and sacertain the transmitted upon a definite basis of c omparisor with the newer exercised on the other whaft

The results of such a reciprocal test will not merely be "well within reason" but will convince the world They will certainty be most satisfactory, but below an efficiency of 98 % G STRICKLAND

correct. The "granny' knot would be unsafe for the erious use to which it would be subjected in case of ire We therefore publish the foregoing diagram in rder to correct any liability to mistake—Euros] fire

New tometary Theories,
Neither the cometa seen for the first time in 1908,
nor the periodic comets of Perrine and Winnecke
which reappeared nearly in their comments. any special interest Halley's comet responsed in the position calculated by Cowell and Crommelin It with first detected in a photograph made by Wulf, at Helde nru catected in protograph make by worl, at reduce borg, on September 11th but was subsequently found on a piste exposed by Keeling on August 24th its brightness increased abovy nutil the end of the year its spectrum, first observed in December, showed the absorption bands of nitrogen and cyanogen, with indi-cations of self-iuminosity due to incandescent gases

The past year is marked especially by the resolts of the retrospective study of the spectroscopic and direct photographs of Morehouse's comet (1808 Ci, was barely visible to the naked aye axhibited several divergent bright talls accompanied by streamers darker than the sky, as if the space sur-rounding the count were filled with luminous matter rounding the samet were mired with nummons matter Subsequently, the tails beat and evoused, and Melotte observed a diminution of brightness at the point of intersection, as if one tail absorbed the light of the other Several times the tail appeared to break up into knots, which formed new envelopes and moved away from the head with hereasing velocity. Com on of successive photographs showed that the

ture were rotating about a central axis. The stereo-aconic combinations made by Barnard appear to indicate the presence of tatis of helical form, but Barm suggests that this effect may be due to changes of form in the intervals between exposures Crom observes that the apparent rotation of the talls may also be an illusion It is sufficient to suppose that the also be an illustrative in a summission to suppose that the head rotates slowly and projects particles rapidly in a plane which follows the rotation of the tails repre-sent the trajectories of particles, forces emanating m the head and from other points must co-operate with solar attraction and reputsion. The occurrence of four successive outlorests of activity suggests the influence of a medium of variable constitution, formed by particles ejected by the sun and made visible by the passage of comets, either by electrification or by carrying cometary matter with them. This hypothe-sia would expinin the presence of cyanogen and cer-tain other lines in the spectra of nearly all comets On this theory the apparent boundary of a co tail like that of a flame, would be simply the locus of a change of physical state

In the spectrum of this comet, E t' Pickering found six absorption bands corresponding to the principal lines of hydrogen At Meudon and Juvissy a faint con-tinuous spectrum indicating self-luminosity, was ob-served Designers regards the three pairs of bands as doubles, due to the Doppter effect and deduces for the cometary matter a velocity of more than 1,200 miles per second but the presence of a strong single line in addition, leads Campbell and Albrecht to re tect this interpretation

The (urrent Supplement,

A thoughtful yet popularly written article on Hered-ity by Prof W E Castle of Harvard University opens the current Supplement No 1797 The article shows that before any serious attempt can be made to im praye the human race considered as an assemblage of animals possessed of verisin desirable physical and intellectual attributes it is obvious that we must know mething about heredity in general and he ticular each of the desired physical and intallectual attributes is produced in his article he reviews briefly some of the problems which the sindy of hered ity presents and some of the results nitatined from their consideration -- Hir William Crawford concludes manufacture — Sketiac or tac is one of those sids to civilization shout which there has tended to atmosphere of mystery and romance. Mr G Clarke Nugent removes much of this mystery to a strictly scientific account of shellac and the fac industry— A Roce's instructive article on how to build a profits puppet show is concluded—A critical consideration of the Maliet tocomplive in service is published.—The chemical regulation of the processes of the body by means of attrators, kinases, and hormones is dis-cussed by Prof William H tlowell of lubna Hapkins University—Mr William E Stark's paper on Measuring Instruments of Long Ago is encluded—We are very ago to regard the tail of an animal as merely "the very spit in regard the tail of an animal as meroly the other end" in the body but Nature seems to have early esteemed the member highly and in have made it her most efficient instrument of incomption. . THE ALBANY-WAY TORK ARROPLANT PLICET.

An April Tornede.

One of the most remarkable dett s of 'wireless has been made in London possibilities of wifeless has been made in London last month, when Mr Thomas Raymond Phillips a Liverpool engineer, conducted a series of experiments on a small scale with a dirigible balloon entirely manipulated and controlled from the earth tests were made at the Illippodrome one of Landon's tests were made at the improvement of Postdons
the lines of the Zeptelin but only 20 feet long. The model complete weighted about ten pounds and the acrosint was filled with hydrogen

During the demonstration the inventor stood on the stage of the theater while his machine maneuvered board something like that of a typewriter but rathe larger, and in reality composed of a number of push switches, above this was a small transmitter sim to that used in ordinary wireless lelegraphy merciy pressing tin keys Mr Phillips showed that he could make his dirigible do anything he liked the would press a switch over and the machine would prumptly rise, the actuation of another key would produce a descent Forward and backward motion was also obtained with perfect certainly as well as

do niar flights and point to-point soyages which involved very in tricate steering. The experiments lasted some hours but never ones illd the model fall to ild what the invenior had announced it was about to do Tiu most effective demonstration however, was that in with h the ness of such a ma ar of the dirigible had a trap door floor under the control of the operator who after manuscured in the operator who after manuscurering the machine over a certain spot, openal a switch which caused the trapdoor to open and ellowed a number of paper lumin

The mechanism of the invenion is extremely simple and or that could be made perfectly rele in the sar of the ballo are a number of solicrers sulted rent electric wave lengths, and these control sinall switches which put into und throw out of action two sets of propellers the trapdoor, and the system of iamps whereby the sirehin can be lit up when desired. The accumuand lighting the lamps are car ried in the car. The directional control of the airship is effected in a horizontal plane by a pair of propeliers hing out from each add of the car on outriggers similar to those of the 'Reppelin' Either or both of these can be driven, and they can also be reso that the machine can be steered to the right and to the left kept in a siraight course, or reversed back in its own tracks without turning round

Two horizontal propellers con siderably smaller than the driv alderably smaller than the visi-ling screws are also ulisched by materials to the nacelle, and provide the manufacture of the nacelle,

for control in a vertical plane. The machino is so balanced as to be approximately equal in weight to the sir it displaces consequently, when the horizontal ellers are not working it neither rises nor but can be made to ascend or discend by putling their In motion Thus by using one vertical propeller and the horizontal mest the machine can be caused to move he a spiral path, and by cutling out the vertical screw It can be made to rise straight up

The switches whereby the machine is controlled after the wave length of the electricity produced at the transmitter, all the coherer switches on the eir-ship being timed to different wave lengths.

The demonstrations have been so successful that the British War Office have investigated the matter, and it is understood that they have taken the invention up. At any rate tiluls with a full sized machine are shortly to be made and if these are successful the invention will be bought by like government. The dimensions of the full sixed war machine will be 60 feet long and 6 feet in diameter, and it will be capable of carrying nearly a couple of hundredweight of ex-plosives while its radius of action will be well over 100 miles Its speed will be about thirty miles pe

MR. FRANK COULD OFFERS SILORS TO THE

SUCCESSFUL DESIGNER AND DEMONSTRATOR OF A SAFE MEAVIER-THAN-AIR FLYING MA-CHINE EQUIPPED WITH MORE THAN ONE MOTOR AND MORE THAN ONE PROPELLER.

The facaimile letter of Mr Edwin Gould, printed on this page, in which \$15,000 is offered for the best successful heavier-than-air flying machine, driven by more than one motor and one propeller, speaks for it-self. It may be pointed out, however, that Mr Gould, self it may be pointed out, however, that Mr Gould, in offoring his prise, has been moved by other cou-siderations than those involved in a sporting contest. Races, long-distance flights, speed tests, and other record breaking performances, have no doubt dome much to bring the flying machine prominently before the public, but it must be admitted that healdes what ting the natural human appetite for competition and driving home the truth that the flying machine is destined to play an important part in future hums affairs, such contests aid the ert but little

It is Mr Gould's primery intent neutly invention and with that and in view he offers a prize not for the fastest flying machine, but for a

Hopes made of the bun.

The sta cap to sighted with temperature can exist by the possessorie of cannot be theseopes, consequently the amounced discoveries, for annexue; but astronomer are constantly placing their chief reliance on the six instruction results of procise measurements and deligible of the constant of th tended results or precise measurements and deligible and long-continued observations, and they do not accept the physical theories advanced until after a comp time of probation. Even data which have been admitted and used for many years are not exempt from criticism. Thus, the siemests of the suits roution time determined by Carrington fifty years ago, which tion determined by Carrington fifty years age, which are still used in the reduction of the photographs taken daily at the English observatories, have been called into question. Purper has examined the new neuroscuts made by Peters between 1860 and 1887, which lill the gap between Carrington's work and Greenwich photographs. He reaches the surprising conclusion that the sum potes of the morthern and southern hemispheres revolve about two different analysis of the contrast and southern hemispheres revolve about two different states, which make with each other an angle of the northern and treed in the contrast of the

ots has been often discussed and generally rejected In its fevor, however, may be oited the proved fact

that the last maximum in the number of spots which was an-nounced for 1905, was delayed nearly two years, and that this retardation had been predicted by Brown as a consequence of motions of Jupiter and Saturn

The solar activity gradually de-creased in 1909, as had been exrted Nevertheless, a group of ots remained visible from Noer, 1908 to April, 1909 group which appeared in Septem group which appeared in Septem ber 1998, was found to be con-nected with a violent magnetic storm Lockyer's photographs mads with the spectrobellograph, show that the principal spot was gradually chilterated by clouds of alcium which exhibited a cyclonic fore the structure thirty hours be maximum of magnetic disturb-ance Mitchie Smith observed that an extraordinary outhorst of activ ity in the sams spot was quickly followed by violent and prolonged agitation of the magnetic ne This group of spots affected the e magnetism in four su which it produced two disturbances at intervals of five days. This fact suggests the influence of two limited and divergent beams analogous to the doubt

intervals of 27 or 28 days, is well established for magnetic storms and surors: The question has boen asked whether other terres trial phenomena do not eimilarly show the influence of the sun's rotation. From the records of cyclones in the Indian Ocean, Maunder finds that an interval of

Maunder finds that an interval of 28 days is of common occurrence.

The first results of the total eclipse of 1908 have been published. The report of MacCleanz expedition say that the corona exhibited the character, usual at intermediate expects, of great extent in the middle islitteds, that that it was distinguished by certain features from all previously observed coronas. The coronal rays or streamers showed no connection with the protuber-or transmers showed no connection with t

To the Editor.

The Scientific American. New York City.

Deam Stur-

In order to promote progress in aviation, I offer through the Scientific American, a prize of \$15,000, which is to be given to the inventor who designs and demonstrates in this country the best heavier-than-mir flying machine equipped with more than one propeller and with more than one independent motor, in such manner,

that the motors can be operated together or independently.

My objet on offering the prime is to encourage the invention of a heavier-than-air flying machine which will be able to continue in safety on its course, even though one of the driving davices should break down.

In order that the efficiency of the inventions may be thoroughly tested, it will be necessary to subject them to andurance teste of stipulated length of time or distance.

Full conditions governing the sward of the prise will be

announced in a later issue of the Scientific American, Lune Touth

MR. EDWIN GOULD'S OFFER OF A \$15,000 AVIATION PRIES

type of flying machine which has thus far not b constructed. Absolute safety must certainly be at-tained before a flying machine can ever become even n papular vehicle of pleasure, and the attainment of safety is the chief object which Mr Gould has in view The conditions which will govern the novel contest

The conditions which will govern the novel contest which will be inaugurated by Mr Gould's magnificant offer have not been decided upon as yet. They will require deliberation. It is hardly likely that we shall be able to publish them for three or four weeks. In the meanwhile, the Editor will gladly consider any suggestions which the readers of this journal may make so that conditions may be drawn which will be fair and which will best serve the object of the prise.

Klustic energy is the power stored in a moving object which keeps it in motion By way of lijustration. conceive a railwey train rushing along a straight, level stretch of track, the train being driven to its power limit If the source of power, say the steam pressure, is now suddenly removed by closing the throttle, the train will continue to run or "coast," for a long distance, due to its kinetic energy, gradually reducing in speed until the energy is exhausted and the train

The United States during Pebruary produced pig iron at a rate which equaled 31,650,000 gross tons per cunum During January the rate was about 31,000,000 tons, and in December about 31,450,000 tons. In companing on these figures, the Iron Age considers it is questionable whether the February rate will be maintained during March, since the daily onwill be maintained during March, since the daily ou-pointly of olse and antiractic furnaces in tax at the beginning of the month was \$44,854 teas, whereas the daily rate of pidotecies for Perburary was \$5,54 teas. "It is hard to realles," the Journal remarks, "that in Phrusary the production was more than 60 per dent above that of Pebruary of last year, and nearly \$1/5 times title of Pebruary to years age, and yet that so little motal is presenting on the market. It is not surprising that a quadrate in scaled of the fift-ity of the country, to showed pig tyon, \$5 time prepar-ties the property of the production of

DR. ROBERT KOCH, THE FATHER OF PREVENTIVE MEDICINE.

BY JOHN B. HUBER, A.M., M.D.

Dr Robert Koch died on May 27th last. To estimate the value of his work, we must consider how humanity suffered from disease before his time Before the beneficant inoculations of Jenner, ep-

semics of smallpox devastated wast regions, decimating cities and wiping out whole towns and villages. Nearly cities and wiping out whole towns and vilinges. Nearly very wexfare one not was a pock-marked survivor. The dreadful bistory of the imbonic plaques is look in registering to the second survivors. It is not to be a registering of the second survivors of the second survivors. The second survivors of the second survivors of the second time at Best-Shemach, and those 70,000 others were destroyed by the microscopic Best-Size periffs Before and since the Trojan war (in which this garm did its and since the Trojan war (in which this garm did its

and since the Trojan war (in which this germ did its greatest execution), throughout the middle ages, and indeed up to our time, scores of epidemics of the bubonic plague have wrongby ghastly pague have wrongot gnastly havoc One of these, the Black Death of the fourteenth one on tury, destroyed most mis-erably (so Gibbon computed) one-fourth the population of the then known world

Malaria, though not so eath-dealing an agency, has nevertheless dreadfully affect-To cite but the one historic To cite but the one historic distance given by W H I I Jones of Cambridge As is so often the case in history, the conquering Greeks under Alexander were conquered by the India they invaded, and its weapon was one much more potent than the swordit was the microscopic ma-laria plasmodium. Upon its inroads the Greeks began to e much of their is tual vigor and manly

Consider finally tube iosis - consumption - which has probably always afflicted mankind At any rate Hip pocrates twenty two contaries ago, wrote of it as the disease which above all others caused the most suffering and the greatest number of deaths The dreadful infections here somely picturesque in their ravages, have been dwarfed by consumption in the nineteentb century fourteen mil-lions died in war, by hullet and steel and camp diseases, during the same period thir ty millions succumbed to consumption From time immemorial every third or fourth adult—in some comhas succumbed to insidious phthisis We whites have in-troduced this disease among negro "brethren," who die of in greater numbers than it in greater numbers than
we do, and among our Indian
"wards" who are fast disap-pearing by reason of our tu-berenicsis, aided and absteted by our "fire water" Who

has not, either in his family or among his friends, had to endure some experience of the "Great White to endure some apperience of the "Onest White Faguer?" Think of ill Between adolescence and the Strydfit year, in those years when young men and young woman contemplate marriags, when when when young woman contemplate marriags, when when we should be strong to maintain their homes, when we should be strong to maintain their homes, when we should be strong to maintain their homes, when we should be strong to maintain their homes, when we should be strong to maintain their homes, when we have the contribution been distaining every third or fourth of our most produce reserved how the truth the many months and the years of this chronic disease, his family must endure the privations imposed by it, and oftening it sizes themselves become its victims. The world, mercover, has been treasured measurable by reason ra themselves become its victims. The world, merover, has lost treasures immeasurable by reason of epite intellegal seaffice of ones and women of gentles by tuberculosis, "death's direct door to most hard getdents, divines, physicians, philosophers, deep lovers, implies to religion." Tuberculosis has ver boss har as m'est a deventleg booth and concepts has an m'est a deventleg booth and concepts.

factor as it had been a death dealing infection, every year our nation alone has been sustaining by reason of it a monetary loss of more than a thousand millions of dollars

Reflect upon all these things, and then turn the mind to the year of Koch's birth—1843 In that year r entered the university

And let us premise here that in science erest name are landmarks, and the owners of these names have traversed and gleaned in the fields where many a devoted and now forgotten laborer has delved and sown and perhaps eweated blood. It should indeed be sown and perhaps eweated blood. It should indeed be a comfortable observation that in science at least no man works in vain. Full many a one has given his whole life to establishing a fact, or indeed only an

DR. ROBERT KOCK

ttem to a fact, his industry unrecognized, ridicule and even persecution oftentimes his only compensation, ilv-ing perhaps in the pitifulest destitution, yet his life and his works have been absolutely essential to the nniversal scheme There is the human unit, and there is the welfare and the very existence of the race, which latter were impossible without the self shuegat which latter were impossible ing labors of the individual

Nor does it in any wise detract from the gratitude due the great man, that he had profited by the labora of others, adding what he can of his own, scrutinizing every detailed datum in the whole fabric permeating and illuminating it with his own mind, and extracting from the mass the mighty deductions of genius. Thus did Jenner's inoculations, upon the principle of fight Lister and Partenr, upon whose substructure Koch built. These isttor developed the germ theory of dis-case, Eoch made of this theory the acience of bac-teriology, which is to-day the most potent factor in civilination. Pastsur declared it to be within human r to banish all parasitic dis

of the earth, Koch clearly demonstrated how this business was to be gone about.

When Koch was seventeen he persuaded his father

When Koch was sevention no persuaged its into to get him a microscope Pussessed of this most congenial companion, he set about perfecting other technical means of investigation. For even genius cannot work effectively without good tools. After st country doctors in medicine be became a simple country doctor, utilizing the time which-nournful to elate every beginner in practice has a plenty, in elentific study experimentation research, and writ scientific study experimentation research, and writ-ing in those years he laid all the foundation of his future greatness. At that time he was not enrolled in any world-famous institution, nor had he millions at his back Such aids to success are not to he

Buch adds to success are not to be decried, yet it is amazing how frequently genius, burning to gundenthaby in the service of bumankind has man aged to get along without them, how they never avail them, how they never avail at all in the absence of the

But soon the German gov ernment became cognizant of Kochs writings. That gov ernment recognizes good work; it avails itself of abil ity, it engaged Koch in its It 1882 came his truly

It 1882 came hie truly epochal discovery of the tubercle bacilius, the essan tial cause of tuberculosis Here was laid down the sure and scientific basis of the anil tuberculosis propaganda which has since been so suc casfully waging Upon this essures intelligently formu laied and with wonderful result up to our day In Prus sia (Kochs own country) the consumption mortality been reduced forty per cent, in Boston, forty five per cent, in New York city fifty per cent in our northern cities cent in our northern cities twenty per cent in the years of 1901-6 And it is being confidently predicted on the basis of the prophylaxis thus dren-ves, even we in this generation-may see ihis dreadful scourge of the cen turies all bul eliminated from human experience Koch elaborated various tubercu-lins diagnostic of tuberculosis. their curative properties have unfortunately proved disappointing yet they were the basis of the wond rfully effective anti toxins of diphtheria, telanus (the most agentaing of all diseases of which formerly nearly all the sufferers died) meningitis pneumonia, and other dreadful infections

And Kochs archivements
And Kochs archivements
In tuberculosis were only a
part of his service to mankind in 1884 he discovered
the cholera bacilius which is responsible for that
discase in the investigation of other world scourges-(ancer bubonic plague septicamia (hiood poisoning), tr; panosomiasis caitle plaguo, anthrax maiaria— Koch's part has been most vital, elther as discoverer or as originator or developer of prophylaxis and cut tive methods

He showed how malaria could be absolutely van quished by stamping it out of the island of Brien in the Adriatic, under commission of the Austrian government. In Hombay he studied the bubonic plague at first hand. When long past threescore he repaired to a desolate island in Victoria, Nyanza his only white companion being an army surgeon and throughout the whole of eighteen months they together saw but the whole of engineer months into the work out of a single log, was their only means of communication with the mainland. There Koch discovered the croco-dite's blood to form the chief monthshuent of the tactus fly, the blood-sucking insect that transfers the (Concluded on page 480)

446 WATER REATER FOR ELYCHER BOILERS.

MASS WATER STATES TOR ETTERES SALESA. THE TOTAL A STATES A SHARM TO SALESA. THE SALESA such amount as may be required for the time being The heater as illustrated in the vertical section, Fig. 2, and cross section, Fig. 3, consists of a copper coil, in-closed in a casing, with a gas hurner in the center of the coil, and it is connected to the kitchen boiler at the coul, and it is connected to the attenen conter at the top and bottom. The gas burner can be made with or without a primer or lighter it can also be connected with a self-lighter to be operated with a

connected with a satisfighter to be operated with a push betton in the usual way. Take an ordinary thrade copier tube about one inch in diameter, and ill it with like send, closing the ends with stoppers. With a wooden mailer height about 3 inches from such end to fatten the pips, until it is \$1 orch in likitaness. After this, make a wooden centre of the control of the control of the tube in now fastened to this wooden conter and the fast pipe is wound around the same, formular a close helit. The wound around the same, forming a close helix. The other end is then formed over the taparing end of the wooden center by hammering it into place with the wooden center by hammering it into piace with the mailet, until the coils begin to close up, leaving abough space for the spent games to pass out. The end must of course be made straight and in the cen-ter so that it will enter the central hole in the casting

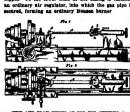

cover which is to be connected to the boiler
After the coil is made into the required shape, the actor the coil is made into the required shape, the stoppers in the ends are removed, and the sand made to run out by turning the coil around and tapping it lightly with the mailet. It may then be connected to a faucet and washed out with water The lower end of the coil may be bent at any angle to suit local

constitutes

The externally threaded end of an ordinary % inch
union is now slipped over the end of the coil which is
peeted over, say about 5/16 inch, forming a fange
which serves to connect the copper tube and iron
pipe with the ordinary union. (See Fig. 4.). This

Scientific American

The burner is made out of an ordinary nipple, with case on each end. In the sizyles are drilled a number of small bole, inside the nipple are a multiper of small bole, inside the nipple as a multiper or cylinder with conical bottom, and provided with a small finange at its upper end, where it is familiar between the end of the sluple and the cap. The object of this cylinder is to partly fill up to inside of the nipple, leaving a small annular space for the gas and air to pass up and out through the small boles after to passe up and out through the small boles in the nipple. To the lower head of the casing is fastened an ordinary air regulator, into which the gas pipe is secured, forming an ordinary Bunsen burn

HIDE AND PLAN VIEWS OF RIG FOR CUTTING A

The main feature of this heater is to introduce the water in a very thin, circular sheet surrounding the central heater it will now be seen that when the gas is lighted the water in the flat cell becomes bot gas in ignose the water in the nat cont occasions not and starts to circulate around the fire up the spiral course to the top of the boiler. The temperature of the water may be regulated by inserting a vaive below the coil, but for ordinary use this is not necessary. Fig. 1 shows the complete beater connected up to a

kitchen boiler with a vent pipe for the spent gas connected to the chimney

Fig. 5 shows how the heater may b Fig. 5 shows how the heater may be fitted up with a primer, or etarter for the gas, which is merely a small independent Bunsen burner, connected below the regular mixing tube. This burner is first lighted, the fame will shoot up into the beater, the ordinary gas-cock is then turned on and the gas ignited, when

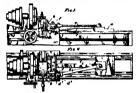

generate in the turned on and the gas ignited, when the pringer may be turned off. This is only a matter of convenience in starting the big burner, as a match of a stary will do the same that the property of the start of the s near, or it may be connected to the water faucet. The apparatus is quite simple, it is only necessary to push a button, which will ignite the gas in the bester, and then open the faucet. The cold water iu the pipe will run out, of course, before the hot water

TURNING CONCAVE AND CONVEX SURFACES.

TURING COURTE AND CONVEX GURLACES.

AT A. A. TERMAND?

Bome time ago the writer had occasion to make a pair of laps for grinding telescope lenses, and as this calls for very accurate work in order to get a true calls for very accurate work in order to get a true urier, it became necessary to make the situachinenia which are bere described. In this class of work it is imperative that the utmost care be given the construc-tion of the several parks, as upon the accuracy of the measurements and nicety of fit depend the quality of the finished product. There must be no lest motion supwhere, as this would mean chatter marks on the

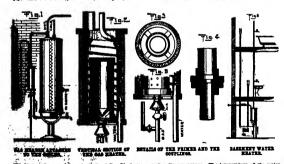

LATER RIGGED TO TURN A CONVEX

surface of the work. For this reason it is better to use taper pins or boils as these will insure a close fitting pion, and the extra trouble will be more close fitting pion, and the extra trouble will be more promuse. It is far better to have it too heavy tinns too light. Nothing is better than a good test from lar, for it is less ago to spring than acted For ratil of it of it is less ago to spring than acted For ratil of its to it is been also beying than some for reality in to 24 inches, a bar % by 1% inchi cross-serious into in one too heavy, while for radii of 24 to is inches % 9 inches is of about the proper propertion.

Figs. 1 and 2 show front and plan views respectively of the concessor enteclinent! The radius line is a labored to make a close fit on the uses of the tall-stock.

spindie, and is provided with a tightening screw b observed that the block is split where the tightening radius bar are now finished on the inside, and tho holes for the pin or bolt d are drilled. Care should be used to get these holes directly in line with the Do used to get these noise directly in into with the dead centre, it may appear that a slight variation one way or the other may be of no account, but it is a good mee hank always adheres to the rule "Anything word" doing at all is worth doing well. The block of its secured in any suitable manner to the took post alide. At this part of various makes of lathest different to the control of the c it is impossible to give a form of block to fit ell but it is impossible to give a form of block to fit ell but any good mechanic can devise means for securing one to his lattle. Regarding the radius bar: filter can be add except the spacing of the holes. Do the eccuracy of the curve of the part machined Fig. 2 shows the tool on a line with the center, Tho that stock a show at the tool on a starting to cut. The tall stock has excluded in position it is set before starting to cut. The tall stock is now changed in position. tion, while the lathe carriage should be free to move back and forth on the ways. As the tool post slide is back and forth on the ways. As the tool post side is drawn toward like operator the carriage will be drawn back, causing the cutting tool to describe an arc the radius of which is equal to the distance between the centers of the holes in the radius bar. The tool is fid to the work by turning the hend wheel of the tail stock screw while the cross feed is accomplished in

the usual manner Figs 3 and 1 represent the device for turning consurfaces, which is somewhat more complicated then the mechanism described above. The radius bar used for concave work can be used here but all of the uther parts must be made especially for the purpose. The block a must be planed and fitted to the inner ways of the lathe and mounted in such a manner that it can move freely backward and forward. The slide d which carries the cross-silds block d' is securely boited to the lathe bed Boited to the sliding block d' is the to the latbe bed Bolied to the sliding block of is the bearing of to which is severed the forward end of radius star or. On the upper side of block of is a roller which runs in the slot in block of the latter being secured to the tool post carriage. The latter carriage and block as arrightly connected by means of the and block as registrally required to the hridge who as above by the dotted lines. The opportunis is es, bearing in mind that side d is rigidly as follo secured to the bed As the tool post side or cross side is fed forward, the siding block dt is carried with it hy means of the slotted block b and roller f. As slid-ing block d' advances carrying with it the forward end of radius bar c, it becomes apparent that block a must move backward, and as this block and lathe carriage are rigidly connected by bar c the lathe carriage will be carried with it, the result being that the tool is caused to move in a reversed arc. It might be well

Fit thereon a coupling sieeve made of insulating material as shown in the sectional between the The insulator can be made out of either herd rubber or vulcanized fiber turned in the other nerd rubber of vulcanized note turned in the inthe, with a milled center to admit of a firm grip when serewing or unserowing the parts. Since oil is an inaulator, no current can get past the coupling sienve to the oiler's hand

INSTANTANEOUS WATER HEATER.

The old proverb, 'A wetched kettle never bolls," does not apply to the water healer shown in the accompanying litustration because hot or even boiling water on be drawn from it, the Instant it is put into opera-on. It is made from an ordinary copper funnel and Hon cake tin

The copper funnel should preferably be tinued on the outside To the water supply pipe is attached a valve for the regulation of the flow of water To this veive is fitted a short nipple and an ordinary toe fit-ting. One end of the arm of the tee is fitted with an ordinary ping which is bured and reamed out to fit the small end of the funnel and the end of same is inrned over with a small hammer and soldered to the plug The other end of the tee is filed to fit very closely to the outside of the funnel, leaving, however, u slight annular opening which may be regulated by is turned on it will flow in an even thin sheet over the funnel

incide the funnel is an ordinary was burner, anch

HOME-WADE INSTANTANCOUS WATER HEATER.

as may be purchased for ten cents. This hurner is connected to the gas supply in the usual manner it will be noticed by referring to the illustration that the funnel is in an inverted position. The lower part of the funnel is surrounded by en ordinary cake me or me tunes is surrounced by an orimary case movement, with the inside cone partly out off. This in forms a basin for the hot water which may be drawn off with an ordinary fauest soldered to the cake tin, or it may be run off as the water heats. It will now be seen

that when the gas is lighted the funnal becat once, and when the water is turned on it is to through the narrow opening between the tee and the funnel in a naiform thin sheet which spreads over the funnel in a naiform this about which spreads over the funnel and bocomes hot as it flows down. Almost any degree of heat may be obtained by requisiting the flow of water with the valve. The spent gause from the gas hurner pass up through the funnel and out to the atmosphere. Some arrangement may be made to con-nect the water and gas valves so that they will be turned on simultaneously, thus obviating the danger of overheating the funnal

STRAM BOXES FOR BOAT BUILDING. BY A, P RES

A eimpic method of rigging a steam box for boat work is as follows Take a common wash boiler, put work is a tolows "ake a common wash fooler, put a 1% inch hole in the cover to receive a short plece of tahing 2 or 3 inches long, which should be soldered. The stamn box is made of wood, of any length desired, and about 10 inches high by 8 inches wide inside Make a couple of hockes hollowed out to fit the top of boiler cover, and nail them to the box. Out a round

STRAM BOX CONNECTED TO A WASH BOILER.

hole in the bottom of the bex to receive the tahi that has been placed in the cover of the botter Be careful not to allow the tuhing to project inside the careful not to allow the thing to project inside the box. The ends of the box are generally stopped up with old rags. In operation put about a paifful of water in the boiler at the cover on, and then lift the

STRAM BOX COMPRCTED TO A CAST-IRON MUTTLER.

steam box and place it on top of the cover, allowing the tubing to enter the bottom of the box Another method of constructing a steam box has

Another method of constructing a steam how has been devised by William Ells, a beat halled: It is made by taking a cast iron muffer, plugging the lower end, and connecting a short length of 1½, inch pips to the opposite end A tee is put on the end of the pip with a short pless of 1½ inch pips served into the tee at right angies to the number pless. The upper and of the tee is plugged up with a wooden plug, if there is no reducer handy

Bore a hole in the wooden plug, and server into it a short pleve of % inch plue, fitted with a stop cock of some sort. Above the stop cock, place a can be of some sort. Above the stop cock, place a can be simply boring a hole in the bottom and servering to simply boring a hole in the bottom and servering to the short inleps above the stop cock. In operation, the muffer is placed in the store with a coal or woold for. A plece of sheet from with a boat brought which the plue projects, serves as a corer for the store, where is poursed into the plant poil; and allowed to run down into the muffer as desired. A wooden stam bor mounted on legs is connected to the muffler by the 1½ inch plue. This style of boiler is not injured it boils oft, and is frequently red holv when the water is put in This, of course, makes it "fashty," but otherwise no harm is doos, as the pipes to of sufficient size to handle all the steam that is generated. Bore a hole in the wooden plus, and acrew into it a

Hartine West's scorts us near a began, A best disht in more appeared it ensures attaches of the elements this say speter spat of the boot. MARING TIGHT JOINTS IN BOAT BROKE

as pretty a deck as a tight seam, made in the following

manner. Have the wood thoroughly seasoned and make a nice fitting joint for the deek plank that you are laying next to the plank sheer. Whan this is done, take the place out and with a smooth steel rod or hurnisher of some kind, burnish down, with quite a of the accompanying drawing. This of course compresses the wood Now plane the wood down on the jointed edge, making a true corner again This is now ready to fasten on the deck carlins Proceed in like ready to fasten on the deck earlies Proceed in like manner with the rest of the deck planks. The joints on a wooden tank or vut can be made tight by the same principle. Instead of brainshing the corner a round red is laid in the center of the jointed piece and with a hammer is forced nearly half its diameter in the wood (86e Fig 3). This is planed down until there is no groove left, each joint is treated in the same way. When the wood is meistened, the part that has been compressed by the round red will expand This produces a very tight joint.

by removing the cylinder heads I discovered amail
particles of metal around the edge of the cylinders and the cylinders themselves were scratched up. Trac-ing this to its cause I discovered that the feed pipe was elmost clogged up with small particles of corroded was sinuct clogged up with small particles of corroded copper Going krither, ny gasoline tank showed signs of corrosion which is attribute to poor gasoline, con-taining considerable mostature thereby causing corro-sion of the copper tank. After giving my tank a thor-coph washing and scraping I shad it electropiated inside with a coating of the All particles of metal were re-moved from the cylinders, the feed pipe was cleaned out, and the parts were connected up I have been trunning any morter for the past sight mentits without ble recurring, and have saved myself the a new tank

HOW TO DRILL A HOLE CENTRAL IN A BAR.

It is a rather difficult matter to drill a hole in a bar and keep the hole central. The accompanying drawing shows a practical kink. A piece of tool steel

METHOD OF REILLING A MOLE CRUTEAL IN A SAR.

A is caught in the lathe chuck, and is turned and bored so the hole will run true with the settide disas-sier. The outside diamater is turned the enter set of bar 3, which is to be drilled. The bar 3 is placed in a view as shown, the drill get at placeds to po or the job, and the view is then tightened up, also the fig and the bar are of the same diagestor. Our place will held them both very rigidly white the her is 30-ters bound.

persons.
THINTHIA ROWN - P. SCHARFER. Oskiand,
Cai. This invention relates to certain improvements in tooth crowns, and more particularly to certain improvements in the manufacture of the pattern or model in intuition of which the gold crown is cast. The tooth crown conforms perfectly to the tooth as an annuals land for fitting around the tooth powers it field desired contour and is all formed of a taigle casting.

HANK NOTH CUTTING If & HOER, Han-over, Pa The purpose of this inventor is to provide a cultur with a pinratity of hisdes, which will hold a sheet of notes in position to be cut when the handle is operated, the frame of the cutter helm open so that the notes fall therethrough when cutting

Meaning and Lighting.

VAPOR BURKER—A H. WATE, M. Fass, III. This invention is an improvement in vapor survey of the Canacter desioned in Letters between the Canacter desioned in Letters between the Canacter desioned to get the responsing barner and directly above the exponenting barner and directly above the remove of this barner, each pine baring an executed to the story. These at their opposite media are connected to a common phy, which passes through an air day, and discharge at the control of the story. These at their opposite media are connected to a common phy, which passes through an air day, and discharge at the control of the story of the control of the story of the control of the story of the control of th

Home Office, Newark, N. J.

A widow, ago 13, lowes in Penneylemia, has just received for fire Producted Menthly Income Check for 50. These Producted checks will some every month for 26 years, or 12,000 in all. He hashead, 11 years odd, took out he polye for The Producted in Perlower, 1901, and deed April, 1911 He paid only the first year yearmoun to Think of the wenderful help shill life intermore smooty will be to this woman. Her hashead GUARANTED 2 a home and Monthly income to his loved once through THE PRODUCTION 100 and to the Company for perticulars of A Monthly Income Paley or WC coppos, SEND TO-DAY.

#### THE MUSEUM AT MONAGO.

(Concluded from page 476.) left contain everytaing reating to physical occanography, that is, the physical investigation of the sea, com-prising all kinds of instruments, such as sounding devices with samples of the sea bottom, bottles intended for taking sea bottom, bottles intended for taking water samples and recording the temperature at a given depth, apparatus for inswellanting son currents and the density of sea wrater, instruments for studying the post-rection of light into the depth of the comma, laboratory installations for the physical and chemical sandysis of sea water and sediments, as many season of shousests contained in wear seasons of shousests contained in wear

collection of siements contained in sea water, sit.

All these variegated exhibits have been provided with labels in the three principal languages (Freed), English, and German) which greatly add to their utility and enhance their inter-national character.

national character.
The first story, which is situated at 64 maters above the sea, likewise contains a large hall, in the center of which is saidhilded one of the Prince's whele-books with the whole of its equipment. On the walls are arranged air comprehensive collections of photographs relating to the voyages of discovery organised by the Prince, and all tinds of other commongraphic subjects. To the right of the services done is not set on the components of the prince of the services of the contract of the contract of the services of the contract of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of the services of t ised by the Frince, and all kinds of other are represented ancient. Greek models commongraphs subjects. To the right of with pictures of fishes, orahs, and dolph the entrance door is located a switch lips as well as Japanese emerating, based for the absorber lighting. The Web which show an admirable treatment of halls adjusting the central hall are like-fishes. From indepressing the central hall are like-fishes. From indepressing the central hall are like-fishes and the second of the second hall and the second hall are represented by the second hall are represented by the second hall are represented by the second hall are the second hall are represented by the second hall are the second hall are the second hall are represented by the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the second hall are the se

sea are on exhibit either in a fresh con dition or as preserve; and even such ma terials as fish oil, guano meal, etc., are

represented
Another subject of great interest, and
which will have to be further developed,
comprises all kinds of fishing instruments (boats, nots, etc.), either in the ments (toata, nots, etc.), either in the natural size or in the shape of displass the models. Many scientists and this Prince himself have designed special mechanical catching outsits for deep-sex stating, while solver instruments had to exopical plankton of the surface, inter-mediary zeroes and see hottom, as well as for catching occan animals of espe-cially large size. All these tensified tunnish are indepensable for obtaining an adequate knowledge of the customs, animals, and apart from their scientific therese, are of much practical utility by interest, are of much practical utility by enabling suitable means of protection to be ascertained in the case of organisms lending themselves for industrial utili

In the same half is found a repr ative collection of art subjects, imitating the wonderful and most variegated forms of marins organisms. Besides the most or marine organisms. Besides the most modern productions in this connection are represented ancient Greek models with pictures of fishes, crabs, and dolph jus as well as Japanese engravings, which show an admirable treatment of

of a collection died for former within the cell
or according to the collection of many.

Juneary No. 8 1862. The cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cell of the cel to this mode because the cyanide is pois onous, and even the fumes, if inhaled will prove dangapus. Although this method may yield good results to some collectors. I have always used a simpler and more effective way. A bottle with a medicine dropper as a cork is filled with bensine or gasoline (8) sect is secured in the same manner as previously explained, and a generous dose previously explained, and a generous cose of bennies is administrated, which kills instantly The bennine will spread over the whole specimen, but soon evuporates and leaves the innect none the worse for the bath When the innect is dead, it is

the pain when the insect is cean, it is placed in a paper envelope made in the manner shown in 10 Some of the large moths have greasy bodies, and will, therefore, have to be degressed. This may be done by placing the envelopes containing the insects in gasoline for twenty four hours or more

Byreading the Insects—If on reaching home there is time to apread the inserts caught during the day they should be taken out of the papers end treated in taken out of the papers and treated in the following way. For use in appread-ing, a perfectly flat board with an abso-lutely amooth surface, some insect pins, some pieces of plate glass of different alsos, and a faw needles stuck into match sticks are needed. The insect is taken between the thumb and the index fanger, and an insect pin is pushed through the between the Limmb and the index finger, and an insect pin is pushed through the thorax, as demonstrated in 11 With a broad-tipped tweezers, which may be pur-chased at any instrument maker's for a small sum the wings are taken hold of small sum the wings are taken hold of where they join the body, and are gently bent open until they remain in a horizon-tal position. Then the insect is placed upon the board and the pln is pushed in. Now a pin is inserted behind the heavy vein, and the wing is gently drawn forwith, and the wing is gently drawn for-ward until its base is prependicular to the body. The pin is pushed into the wood This operation is repeated with the other wings, and stripe of giase are placed to them to prese them fair. The placed them to prese them fair. The placed them to prese them fair. The thought is now gardly extracted. While thorax is now gardly extracted. While the pin is bleng withdrawn, he pieces of giase sheetid be held with the taumh and the first flame of one hand. The in-seds are laft on this hourd for a weak while the pin the pin the pin the pin while the pin the pin the pin the pin while the pin the pin the pin the pin while the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin the pin t

Plants question the SCHOTTERS ANDREASE When widout to extending

(Opnomised from page 400.)-Bases self for any leagth of time thrus-triangular papers, they must first be re-leased or softened. This may be done by placing them over hight between moist cloths in a box, adding a few drops of carboilo acid to prevent mildew. They should then be spread in the manner.

ating.—The last step in the pres recomming—The last stop in the preservation of the insects is the mounting.

There are various ways in which this may be done, but the writer knows of none better than that invented by Denton. Brothers of Wellesley, Mass Cases of glass are made, varying in size with the Cases of size of the insect to be inclosed. These cases permit of a clear view of both the upper and under side of the specimen, upper and under side of the specimen, as the top and bottom are made of glass. The insect is supported by its wings on a glass shelf (15) When the insect is placed in position, the top which is placed in position, the top which is himped at one edge a closed over it and is easied with the passe-parton binding it which forms the sides of the box 80 stmple is this method of mounting, that The mounts can be obtained at prices ranging from five cents up Thee results the mounts can be obtained at prices an other mount with which good results can be obtained. He Riter insect mount. These mounts consist of a next cardboard has been a place to the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract These mounts consist of a peat cardboard box having a glass top cover and filled with fine cotton batting, in which the in sect is readily embedded. The glass cover when closed holds the insect in place. The only objection to these mounts in that both sides of the insect are not visi the poin sides of the insect are not visible, and therefore two specimens will have to be mounted to show both the upper and under sides. Riker mounts may per and under sides. Riker mounts may be obtained from all instrument makers having a natural history department Collection of Specimens -- Now that the

The moths are harder to find because they fly at night. The method most often resorted to by collectors is known as augaring A mixture of brown sugar, stale beer and molasses is made, and at dusk is painted upon the trees. In a few bours, if the locality is productive moths will be hovering about the trees in abundance, keeping the collector bus half the night

Naming and Classifying -When the insects are mounted they will have to be named and classified Butterflies and moths belong to the order called Lept moths belong to the order called Left dopters Few people know the difference between butterfies and moths. There are several great differences. In the first place, all butterfies have cinb-shaped an tenne or feelers, that is, the feelers ter minate in a club. All members of the order Lepidopters which have not clubabaped antenne are moths. In the sec-ond place, all butterfies are diurnal that ond place, all butterfies are diurnal that is, they fly by day, while most of the moths are nocturnal or fly by night Sev eral minor differences may be noted, the first of which is, that butterfies generally old their wings erect when at rest. wasress most or the moths fold them

Becondly, butterfiles transform
from the caterpillar stage to the winged
stage in a naked chrysalis, and moths
have a covering, no matter how primitive, which is called a co

Reference Work,-In all entomological work standard books are necessary in order to identify the specimens. Dr Hol ishing Butterny sook and in here are standard American works, and in them may be found colored plates comprising pictures of most of the butterfiles and suckin of North America, north of Mexi-

BERTILLON AND THE BURGLAR'S JIMMY.

(Concluded from page 484) two dynamometers of unequal power Tho stronger dynamometer having a maximum capacity of one ton and designed for the measurement of vertical efforts for the measurement of verilial efforts is connected to the top of the frame by a seren, by means of which it can be raised or lowered a few inches. The low er spring of the dynamometer is attached to a beavy vertical steel plate, which sildes in grooves along the two vertical posts.
When the index of the dynamometer is When the index of the dynamometer is at the zero point, the bottom of this plate which is about 1½ in hea thick, is about % inch above the siliding horizon tal plate. In this interval is inserted a wooden board % inch thick, with its edge flush with the bottom of the vertical steel plate. The experiment is usedo by inserting between the board and the Ver tical steel plaie the end of a 'jimmy' or other burgiar's tool and endeavoring by noving the handle of the tool up and down, to produce on the board impres-sions similar to those which have been found on doors and furniture The Inde of the dynamometer moves in accordance with the effort exerted and by means of second index which remains fixed when the first returns to the zero mark the instrument automatically registers the

The figure thus obtained indicates only the vertical effort or effort of press but there is sivays a horizontal compon ent of greater or less magnitude and this is registered by a horizontal or traction dynamometer, which is attached to the

sliding horizontal steel plate
Elther of the dynamometers can be Either of the dynamometers can be used alone or both can be employed simultaneously in this way it is possible to measure the horizontals and the virtual efforts separately or in combination in the latter case M Bertilion has found that, as might be expected the horizontal effort is always much smaller than the vertical or recommendations. than the vertical or pressure effort. For example, using a lever 20 inches long a vertical pressure of 1300 pounds was ob-tained simultaneously with a horizontal traction of 330 pounds. A strong man, operating on a hard wainst plank can

operating on a naru watant plank can develop a pressure offort of 1 500 pounds The apparatus can also be turned over on its side so as to place the experimental board in a vertical position for the purpose of investigating the forting open of a door. In this case a second piere of wood is introduced to represent the of wood is introduced to represent the jamb of the door. The same arrangement in the normal position of the apparatus, is used for investigating the opening of a

drawer or a cylinder or other deak etc The idea of employing a dynamometer in the study of burglary appears so sim ple, that it is surprising that it was not done long ago Hemefurth judicial in-quiries will be guided by the results of a series of experiments which will furnis points of reference. From measurements made with the Bertillon dynamometer it is possible to discover whether the hurglarlous entrance was effected in a man. a woman a child or several persons

Finally the study of the impressions made by looks has led M. Bertillon to give these impressions distinct names accord ing to the part of the tool hy which they are produced. The word 'foulce is re-served for the impression made by the point of the tool "& oroure" for the notch made by the body of the tool in pressing on the edge of a door or plece of furni ture, and the word "peace for the indentation produced by the elbow of a 'jimory or similar tool on a plane sur face. For the identification of the tool the most valuable evidence is furnished

NEW YORK, SATI'RDAY, JUNE 18th, 1910 ----

The folion is always plant to receive for examination illustrated articles on subjects of timely interest. If the photographs are short, the erticles short and the forts subject to the contributions will receive special attention. According to the paid for at regular space rates

#### A STREE ARCH SUGGRETED FOR THE OURSES BRIDGE

T the time when the plans for the 3,100-foot fluison River bridge were under discus-sion and it was generally accepted that nly type of structure that w itself to the then unprecedented span of \$.100 feet itself to the then unprecedented span of 3,00 feet was either the cantilever or the suppossion bridge, there appeared a remarkable paper by the well known bridge engineer Max am Ende, in which a design was presented for a steel arch bridge of 3,000 design was presented for a steel area for the property of show which was to be creeted on the cantilever principle, the load, during creetion, being carried by tring it back to suitable whore anchor ages until the final keystone was in place. recent issue of Engineering News, a similar opposition is made by Charles Worthington, for the construction of an 1,800-foot steel arch at the Quebec Bridge crossing. The elevation of the bridge arr Worthington is convinced as the result, it is a superior of the stell says at the register of the problem, that not may world as a time of the problem, that not may world as a time of the problem, that not may world as a time of the problem, that not may world as a time of the problem, that not may world as a time of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem of the problem o

sion bridge cuttrely across the site, and sum-oil; is the individual visualoria, of which the main and is composed, from the cables, the tower ends of the composed, from the cables, the tower ends of the latter being provided with adjustment devices by which the vousours can be held in proper position during erection. The abutting faces of the vousiest would be accurately machined and provided with fagges by which each settlem after it was lowered into position would be secured to the exceed portion of the arch. The arch consists of four parallel ribs of heliow reviaugular settlem, such all free deep at wide. When the lawstome of the rown had been low wide When the keystone of the crown had been low would be slacked up and removed, and the whole suswould be slacked up and removed, and the whole su-pension bridge taken down leaving the four great ribs of the arch ready for the erection of the sup-norting columns and the superstructure of the floor rise of the area reasy for the erection or the sup-porting columns and the superstructure of the floor. The element of doubt which cuters into this design is due to the system of erection adopted it is ques-tionable whether, with the flexible support afforded by the suspension cable it would be possible to hold the rouseours with that absolute accuracy and rigidity which is necessary it is well understood that dur-ing erection voussoirs must be kept in exact position by absolutely rigid falsework. Max am Ende was to secure this rigidity by designing a fram bridge, and tying back the successive sections, as they were added, to rigid anchorages on either shore Fur thermore because of the great weight of the bridge whose dead load over the whole 1,800-foot span is entimated at 25,000 tons the erection suspension hridge would have to be extremely heavy and costly it is but fair, however to quote Mr Worthington as stating that the estimates of the total cost of the structure indicate that it compares very favorably with the cost of a cantilever structure, even if the clabo rate erection plant be considered to have no subse-quent salvage value

#### OF PROPERTY WITH THE AM ARROWAND.

T is doubtful if any one, among the many th sands who have witnessed Hamilton's special

ands who have witnessed Hamilton's speciaciiar flights at Mincola, Long Island, and wondered
at the bird like facility with which he performed
his evolutions, realised that his success was the outcome of some six thousand miles of actual flying which
had done during the next sty months.

come of some six thousand miles of actual sying whom he had done during the past six months. In qualifying for the degree of "hird man," Hamil ton has served a long apprenticeably and has traversed the whole gamut of aeronautical experience. Of light hut athletle bulld, quick but cool, endowed with that intelligent daring which is so meential to success in aviation, he has probably had a more varied experience in the air than any other living man He has been carried up by kites, has not hesitated to cut loose in gliders at disay siti tides, and sweep through perilous distances to earth, and with balloone both spherical and dirigible he is altogether familiar With so much accumulated ax perience of the "feel of the air" at command, and with perience of the "feel of the air" at command, and with his rich andowment of the natural qualities of an avi ator, it was inevitable that, when Hamilton took his seat in an acropiane, he should quickly become one of the most, if not the most, experienced and successful exponents of the new art of human flight. Starting last November with a Curtiss machine, he has spent the intervening months in touring the coun try and teaching the public to what a pitch of per fection human fight has been carried. Four days a ek, for the past six or seven months, he has given roughout the country, largely in the erhibitions th West and Southw or five different flights. Hamilton estimates that the total distance that he has flown through the pathles total distance test he has how through the patients air in the intervening period is approximately six thousand miles, or sufficient to have carried hith from New York to San Francisco and back Just here we should remark that it is fitting that a Hamilton should icave his impress so strongly on the pages of aero nautical history in the United States, since he is a insution instory in the United States, since he is a direct descendant from John H Hamilton the brother of Alexander Hamilton, John H being the great great grandfather of the present Charles K. Hamilton During a recent conversation, and at the request of

My Scylinder, 50 horse-power Curties machine was brought out, and held in position facing the wind As the propeller revolutions increased, the thrust reached a point at which the machine began to lift, and on letting go, the crowd were astonished to so me apparently flying backward. As the motor gains velocity, I first became stationary over the starting point, and then, with full power developed, traveled point, and man, with fill power developed, traveled over the ground at a speed, relatively to the ground, of ten to fifteen miles an hour." On another occasion, at St. Joseph, Miscouri, Hamilton rose and gave successful exhibitions in a wind which the local government anemometers registered at thirty nine miles. ermanet an emonuterer registeries at unitry nine min an hour The young aviator considers that the bugs hoo of the wind has been eliminated, and that from now on the skilled "bird anni" will no longer wait around for three-fourths of a windy day in the hope of making a flight in the remaining fourth It is not the velocity of the wind, but the sudden changes not the velocity of the wind, but the sudden changes in the velocity, that constitute the peril In a gusty twenty-five-mile wind, the velocity will suddenly change, in the puffs, from fifteen to twenty-five miles, a difference of ten miles per hour, and the range of difference increases with the increased speed of the

ATTOMATIC Coverent .- Asked for his opinion of the AUTOMATIC CONTENT.—Asked for his opinion of the value of automatic control, such as might be afforded by pendulum action or by the gyroscope, Hamilton surprised us by affirming that he did not solice in such control "The pendulum effect would tend to become rhythmicat, and the swing might be in the wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the other wrong direction at the critical time; on the critical time; on the critical time; on the critical time; on the critical time; on the critical time; on the critical t ing stratna." Where drying he a guisty which the sub-den questing feyries ming he most cold resultable grad-ually, and the facilities because the not to the harman position "with a locke early" much me a stilled risks will control a sprincial disk nemative heria. "The mis-nipulations necessary to right in asyopiane are too commitment and inter-terminal properties." nipulations necessary to right an seroplane are too complicated and inter-visited to be expaide of abso-tutely automatic control," said Hamilton, "as you will see from the following: If a pull but the right side and lifts it, there are three distinct motions necessary see from the following: It is you are an and lifts it, there are three distinct motions necessary to restore equilibrium. First the wing the or asis-rons must be set to counteract the lifting force; than the front horisontal rudder must be sharply depressed. Assess and sain velocity; and the front horisontal rudder must be sharply depressed to throw the machine down and gain velocity, the rear vertical rudder must be swing over. These movements must be dose with judgment and a delicate touch, and it is difficult for me to understand how the sensitive hand and intelligent mind of the seromant could be replaced by purely automatic appli-nance in a complicated evolution of this kind pull-ture of the seromant of the seromant of the seromant of the seromant of the seromant of the seromant of anticipation of what is going to bandon. Experience teaches the aviator to recognize different and in his manipulation of the control, anticipates the and in his manipulation of the control, anticipates the vanies of the wind. These are conditions which is and in his manipulation of the control, anticipates the vagaries of the wind These are conditions which a parely automatic control could never meet."

Total and report

Wing Strange and Supen .- Hamilton looks for our wind BERACK AND EXPEDITION HOURS for con-siderable increase in the speed of seroplanes in the near future, and believes that some of the more nowerful machines now being built will have made a erful machines now being huilt will have made seventy miles an hour péror the close of the present par Au to the far future, the high-speed racing machine will probably be a monoplane, with long, narrow wings, affording small supporting surface relatively to the horse-power One of the most interesting facts developed during the varied experience of the past six months was the accidental verification of the impormouth was the accidental verification of the hippormouth of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control months was the accidental verification of the impor-tant principle cumunistar by Pro! Langiey, that the bigher the speed of an acroplane the less is the non-any sustaining surface. It happened that in adjust-ing the engine at the commencement of an afternoon exhibition, the intake valves and carbureter caught. See a surface of the control covering of the upper and lower planes were burnt out, instruct grains 150 out of 350 square feet of surface intact. Rather than disappoint the assembled covered of 4,000 people. Hamilton determined to try for a flight. Definantly, a 100 to 130-700 run would have been sufficient, but reaminon determined to try for a might. Orninarily, as 100 to 180-foot run would have been sufficient, but in this case it was not until the machine had run over 1,000 feet, and the engine was working at its maximum power, that the machine iffted Immediately Hamil ton discovered that he was flying much faster than he had ever done before, which, of course, was stri

To is a hint that the racing machine of the future will have some system for recing, which will allow will have some system for recing, which will allow the sustaining surface to be reduced, and shin friction eliminated as the speed increase: Conversely when firing at 81 Paso, in the rarefled air due to an eteration of 3.980 feet. Hamilton found at first that he could tion of 3,840 feet, Hamilton found at first that be could not set off the ground at all The autaining planes were lengthened, and 135 aquace feet were added to the control of the control of the control of the control to the control of the control of the control of the compilated. As the result of this experience, Hamilton believes that records of high dying in which, the ma-chine reaches the rarefled strate of air, should be ac-cepted with considerable caucity.

Not very long ago, timber was selected entirely according to its external appearance. The diameter and length of the piece, the straightness of grain, sometimes the weight, sufficed to destreation both its commercial value and its destriction to that time, on account of the difficulty of transportation, woods of local origin were almost excitavely employed. It is considered to the control of local origin were almost excitavely employed. It is considered to the control of local origin and the control of local origin. The control of local origin and local origin and local origin. Furthermore, the diversation discusses of the present desired as a control of local origin. The control of local origin and local origin and local origin. The control of local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local original and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local origin and local original and local original and local original and local original and local original and local original original and local original or Not very long ago, timber was selected entirely

A dispetch from Berlin states that the "Von der A dispatch from Berlin states that the "You der Tunn," the first of the German devastought cruisers, sindelid, on her jevilminary trials, a speed of \$1 knot, 7th, if tree, places her, in respect of speed, abreaux of the British "lawinoisbes." The latest accounts credit file with earrying eight, 11-not, mus disposed in four therein, one forward, one aft, and two on orderio amid-ships. The displacements is about 19,000 tran.

Figures fast compiled by the Pennarymain Rail-rook system, show that slitheugh in 1909 and 1909 its various lines carried a total of 1997,68,656 passenger on its 49,400 miles of track, cally one passenger was killed as a result of a train week. In other words, the chance of a passenger losting his life in a need-fent on the Pennarymain Railroad system was one dent on the Pennsylvani out of about 200,000,000

Out of about source, or The save beaut which conducted the tests of the ship brake recently fitted to the battlershy "Indians," reports that, though it will stop a vessel in a short distance, it to unsuitable for naval uses. It considers that unless the brake were constantly supplyed it would become desgred with barranches. It would be the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the save that the sav be dangerous in close evolution, and would at all tin somewhat retard the speed of a ship

Secretary of the Mavy Moyer announces that he has approved the plans of the two new battleships which have been voted by the Senate and House. Each will be of \$7,000 tons displacement and will carry an arms ment of ten of the new and extremely powerful 14-inc great. In general appearance, in armor plan, and in disposition of the guns the new ships will resemble the "Florida," which was recently launched at the Brooklyn navy yard.

Brooking many seru.

A comparison of the strength of the navies of the
world in dreadcoughts shows that Great Britain has
averatened of 255,000 tons displacement, Germany thrtens of 275,000 tons, the United States ten of 231,000
tons, Jagan art of 154,010 tons. Remain four of 25,000
tons, Jagan art of 154,010 tons. France has none
of the strictly developinght trye, either built or build
ing. The above Sgurey include both ships completed
and those under construction

Mollow steel masts are not the only kind that carry away. The English racing yacht "Brynhild" recently jost her solid wooden mast which, in falling, seems to have driven through the light shell of the yacht, caushave driven through the right construction of the "Brun hild" was racing against the seventy-footers "Sham rock" and "White Heather." Usually the failing must entirely clear the hull, as happened in the case of both "Columbia" and "Shamrock" I and III during their pective "America" cup racing sessons.

"The bessed of engineers appointed by the Board of Relinate of this city to pass on the plan to distribute the new Catality Massel supply; in the ractous boroughs by means of a deep tempel, one hundred feet or more below the serious, has reported that the transif would color only \$45,000,000, as against \$47,000,000, which would be considered to the lines system of type lines. The contraction is recommended on the growthe both of economical State cost in a second to the contract of contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the contraction of the co

tenance who show decomposition which are included by the force of the final tenant in Russian randow will have accreased accrete features. There will be also foet from, 80 feet became, 60 feet from 80 feet became, 60 feet from 80 feet became, 60 feet from 80 feet became, 60 feet from 80 fee

#### AERONAUTICS.

Capt. Baldwin and Joseph Seymour both gave ex-cellent demonstrations on the 4th instant of their pro-fedency in firing their machines. The latter's biplane is a standard \$8-horse-power Curtine, while Capt Bald win has a Curtiss machine with a tail like the Farwin has a Curtise macaine with a cast time the placed back of the planes and connected to the \$6-horse-power motor. The propeller used is somewhat larger in diam etsr and of higher pitch than that ordinarily em

Jacques de Lesseps crossed the Channel on the list day of May by way of Calais to Dover with a Biériot monoplane, and thereby won the Ruinart prize of 12 000 monoplane, and thereby won the Ruinart prize of 12 000 francs. Count de Lesseps started from the name downed at Barraques, near Calais, from which Biferiot ascended on his memorable flight. The Count ascended at ten on his memorable slight. The Count ascenaes at un minutes to four c'clock in the presence of 2,000 spec-tators. His motor was a Guome, revolving-cylinder en gine of 50 horse-power At a height of 1,500 feet be was lout in a heavy for The torpedo boat "Escopetts," which performed a similar service for Diériot and which performed a similar service for Diferiot and Latham, accompanied him, but found it impossible to keep up De Lesseppe was unable to adhere to his course, partly perhaps because of the fog, and as the "Bacopetta" entered Bower, no one know any thing at all of De Lesseps. He had handed about two miles to the north of Dover, near St. Margaret, and siglided down a distance of about two miles after glided down a distance of about two miles after with ting off his motor. He alighted at twenty two minutes after four, after a journey of forty-two minutes.

sing of his motor. He slighted at twenty two minutes after four, after a journey of forty-two minutes.

After Gount for a journey of forty-two minutes.

After Gount de Lesseph flight across the Magish Channal with the Biefold monoplane on May Jist (which was the second time this trip had been made by any seroplane), the Hom Charles Stewart Rolls, who was the first Englishman to fly with a Wright highan, on Jisten End accorded in making a double biplane, on Jisten End accorded in making a double biplane, on Jisten End accorded in making a double start was made near Dover at 8 30 P M., and W. start was made near Dover at 8 30 P M., and the start was made near Dover at 8 30 P M., and the returned to Bangand, and landed some delation for simulation. After circling twice above the citize for returned to England, and landed some delations from the count. Altern the low countries was a start of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the land of the l

regular and tags: surrounset on a tentry Farman or plane Starting from Chalous at 440 A M the offi-cers few 176 kilometers (109 % miles) cross-country to the artitler park at Vinoennes, which was reached at 7 10 This flight of two and on-half hours' dura-tion was accomplished at a speed of 45% miles per hour. Capt. Marconnet was able to take photographs and make accelerate the would have been of great and make sketches that would have been of great gic interest in time of war. This is the first practical demonstration of the aeroplane for scouting purposes, in addition to its being a new world's rec ord for cross-country flying with two men in the ma chine Another French aviator, Labouchère, flew for ten minutes with two passengers at Mourmalon on

Pervisors to attempting a long-detanase flight from New York to "Pathadepinha and back, Mr Island New York to "Pathadepinha and back, Mr Island gave some beautiful exhibitions of his skill in flying at Mimook the first week in June 19e would rise to a height of from 300 to 300 feet and circle about, at the same time swooping down to within 15 or 30 feet of the ground and suddenly rising again. When he was shown to slight he would shart off the motor at a was about to alight be would shat off the motor at a good height, and dive almost perpendicularly to the earth. When only 10 or 13 feet from the ground be-would level up his machine, and make an archive gilds only a few feet above the surface. He appeared for ries in the biphane as easily and with the most skill that a hardnest rifer rifes his horse, and he seamed to take as much suforment from his diver-dicular prants as did the large number of interested owner prants as on the large number of intersects projektory. The machine he has used since last win ing at the identical reser used by Mr Corties at Haplins. It is very fast, and he as not demonstrated the civility in early two paople, since Mr. Hamilton took and a street of the contract of the civility of the street of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civility of the civilit

#### SCIENCE.

Prof. Dr. Mergerell, of Strasburg, president of the International Commission on Scientific Aeronautics, international commission of Scientific Aeronautics, will accompany Count Spitabergen this summer, and will carry out a sortes of serological observations in that vicinity For this reason it is proposed to hold the "international week" of kite and balloon observations, in which meteoro-logical institutions in all parts of the world partici pats, from the 8th to the 13th of August, this year, end of during November, as previously inter

hates of during November, as previously intended Bernard Strumbes, director of the observatory of Payde Dime, and professor of physics in the faculty or sciences at ICE/monts-Fernard, is deed at the age of 43. He was the author of many memoirs on physical and meteorological subject, and of late had been prominent as the champion of the new methods or weather forecasting introduced by O dulibert of Carn Frunbas endeavored to suplain on theoretical grounds the methods defended empirically by Guillert, put the extensive potentics on this subject in the scientific corrections to the total or procedure results for the procedure of the configuration of the scientific corrections on the total one procedure results for the procedure of the configuration of the configuration of the scientific corrections on the total one procedure results for the procedure of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configura

A fund has been established by Mrs E H Harriman for the collection of complete data on mammals and other animals of the North American continent D C Hart Merriam chief of the biological survey of the Department of Agriculture, will realign from the gov-ernment service to take charge of the work. Carbornadus, which consists cascuttaily of allicon
carbide its produced in the electric furnace from a
mixture of sand, coke, sawdust and rommon salt. With
the exception of the diamond, exrbornadom is the
hardest of all known substances, a ratching even
corundum, which is the hard-st of natural stones axequit the diamond. The rommor has production of casequit the diamond. The rommor has production of cashorundum was first accomplished by Acheson, and the Carborundum Company which he founded pro-duces in its works at Niagara Falis large quantities of queen in its worza at ringara raiss ingo quantities or carborundum, which is in great demand as a pollabing and grinding material. The carborundum hitherto produced contains a trace of uncombined exhon and consequently has a dark brown or black color, which makes it unustable for decorative purposes. Recently however Frank Tone of the tarborundum Company, has devised a method of producing coloriess and trans-parent crystals of carborundum, the refractive index of which is said to be even greater than that of the diamond. Those crystals are produced by charging the furnace with a mixture of d0 parts of pure carbon, 37 parts of quarts, 9 parts of sawdust, and 4 parts of sait. All trace of color is removed from the crystals sait. All trace of color is removed from the crystals by the addition of a small quantity of a metallic oxide, such as oxide of chromium. As the refractive power of the diamond is one of its most valuable properties, and the carborundum crystals possess this property. in a still higher degree, these new gems may be serious rivals of the diamond, if they can be proin suitable shapes and sizes, and can be cut and policed like dismonds.

# TELEPHONIC STETHOSCOPE

BY THE ENGLISH CORRESPONDENT OF THE SCIENTIFIC AMERICAN

Telephone relay with caring removed

Great is terest has been center d among British tele phonic and medical circles in the interesting device invented by Mr S G Brown which was recently dewrited by mr is or brown which was recently us writed before the Institution of Electrical Engineers The vital feature of this invention is the successfu The vital feature of this invention is the accessful perfection of a telephone rejux For many years in rentors have been trying to develop such a relar but have been hadrich by difficulties which many engineers have declared to be uncernountable. As the outcome of aty years patient study and experiment however Mr Brown has achieved success as tests over the truth telephone lines of Great Patials have atribut return to the continues of the period of the continues of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the period of the peri

This r lay will his shown in the accompan-ill stration and the design of which may be said from a reference to the explanatory diagram is

Fig 2 -The reed and contact Fig. 8 - kicctrical or

veloped upon entirely new lines and is based upon the researches of Prof J J Thomson Earhart Kins ley and others concerning the flow of electrons across a microscopic air gai between two conducting surfaces at different potentials. Earhart found that when the stallic circuit is broken by a minute opening of mintallie circuit is broken by a minute opening of the order of 0000005 continuers and the metal at the point of interruptic is platinum the current will flow round the circuit and screen the opening and when this interrupting space which Mr Brown terms the conduction space is sulfarly altered in length the resistance is varied and the vatue of the current forwing round that circuit is greatly affected. This constitutes the fundamental heals of Mr Brown is in the conduction of the current of the current of the constitutes the fundamental heals of Mr Brown is in rention for he points out that this conduction apace is just what is wanted for the current carrying device of a telephone relay where microscopic mechanical movements have to be converted into large current changes But the dimensions of this conducting space are no minute that it is

passes through an feetric are ismp strikes and main tains the length of the arc.

In the disgram Fig 1 there is a permanent mag not N which is continued by soft true point right up to but not touching the inver steel read P. Two sets of cell windings H and X are wound round these soft iron yole obtained one and the telephone current to be magnified errelates round the winding H and con-sequently by vagring the magnetism set the read P in wheating. Shere are top and bottom metal one took please M and O which are opened to as infin-

are so minute that it is a difficult matter to insure and maintain it by mechanical means. Therefore he devised a method whereby the current flowing across the conducting space effects its own adjustment in very much the same manner as the current that passes through an lectric are ismp strikes and main itesimal degree by the fine adjusting screw W, and by the action of the local current passing through the contact and around the winding I It is the action of the local current operating through this winding which forms and subsequently maintains the conduc

tion space

This automatic adjustment is so absolutely per
fect that the instrument may be turned upside
down and yet produce scarcely any appreciable alter even and yet produce searcely any appreciable after stitus in the value of the local current and excitally without caserdsing the slightest effect upon the action of the relay The regulating winding X however must not act when traversed by the rapidly varying telephonic currents and this end is assured by sur-rounding the iron under the coll by a closed dereuited copper sheathing Eddy currents set up in this sheath ing by mutual induction destroy the stell induction of the coll in the instrument librariated heaveilth the contact between the resed P and the centact pieces M and its induction of the relation of the coll in the pencil (Fig 3) with the lower cas fast and affixed to the reed Both are polithed and work under a small drup of thin oil.

the reed sood are positive interest many the depth of the ready are shown in Fig. 1. The connection of the relay are shown in Fig. 2. The connection of the relay are shown in Fig. 2. The resistance required to be intended enter by the resistance required and circulate between the winding R At C is a day cell of normal voltage at R the look resistance required and the resistance and at D an ampere mere or current indicator. The relation to relating the resistance and at D an ampere mere or current indicator of the relation to reduce the local current to half its maximum value. The excent is dopened so at or reduce the local current to half its maximum value. The excent is which it maximum value. The excent is which it maximum value is the rest value of the investion is that the intensification or resumd is assumed applies. The relation of the investion is that the intensification or resumd is assumed applies.

e two relays in

tanctions is the commany to place two rearys in tandem by which means magnification is increased to 400 times. Moreover if a piece of goff rubber be made to touch the reed to assist the natural electrical damping of the reed the voice can be transmitted more distinctly and clearly than econversation were taking place in a room owing they to the complete absence of school

The introduction of the local regulating winding K converts the metal contacts M and O into microphones converse the mean contacts at and 0 into microphones of axtreme delicacy securing a far finer degree of sen sitivaness than could be obtained by light pressur-between carbons. In view of this fact Mr Brown con titued his investigations and succeeded in evolving an electrical stathoscope whereby the sound of bear

#### NEW SYSTEM OF COLOR PHOTOGRAPHY

Babe file intreduction of the Lemmers autochrome prospective points within the hast three years, upon plat a comparity color picture is made at one operating a direct of the conners, cutte an importun has been up to proprevenests in this line, which will overhe quit of the different or of the process of the time that the process of the time of the country duplement outer plants of the different process of the time of the country duplement outer plants control for mecounic expectation in the

The new mystem we are about to describe has this articular feature, that duplicate color pictures can so obtained as Mbifess from the first negative obtained a the camera. It has been perfected and simplified th the camers. It has been perfected and simplified by Mr Prederick II I was of this city and is quite unique in the way certain apparent difficulties are

sales in the way certain apparent difficulties are revenous.

The process in heard on the merging of the three primary color, red, thus, and green It is not three primary color, red, thus, and green It is not the properties a simple in operation as the autochrones process but the following definite adventages over that The seattive plates used keep better developing successfully when several mothers developing to the seat of the process of the procession of the procession of the seat of the seat of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the processi

my use artistic amateur

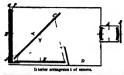

A special camera is required to make the triple negatives but it is very simple and can be used without
change for all ordinary kinds of photography with
plates or films

change for all ordinary kinds of photography with plates or dims.

When it is desired to make a set of triple negatives for color photography a trickromatic plate pack consisting of three sanstitude plates held together as one is used in the special plate held together as one is used in the special plate holder instead of a time plate belief in the special plate holder to the test plate belief has been inserted as to preduce by one expointre three negatives representing the tree primary relors. The plate pack consists of a red sensitive and a gross ensuitive plate with the sensitive or film surfaces in contact held between a backing ord and a blue-ensuitive plate which is hizsped thereto acried in the plate holder the red and prosecentiative seried in the plate holder the red and prosecent in the plates are related by ledges and are pressed in these contact film against tim by a spring on the lid but it falls or passes outward between the ledges. When the hise-sensitive plate is made slightly shorter so that it falls or passes outward between the ledges. When the hise-sensitive plate is made slightly shorter so that it falls or passes outward between the ledges. When the hise-sensitive plate is made slightly shorter so that it falls or passes outward between the ledges. When the hise-sensitive plate is made slightly shorter so that it falls or passes outward between the ledges. When the hise-sensitive plate is the stripler as shown in the diagram and the usual componenting covers in placed over the iess tube. These the powers is made by means of a tube to the Time the ex-posure is made by means of a tube to the three the powers in made by means of the letts shutter which is

said to be shout as long so that required for an autochrome plate Referring to the diagram, A is the lens having a

compensating color erress B attached to it which equalises the exposure for the three images and per fects the color selection O is a binged transparent

The plate helder is inserted at the bark of the camera under a ground glass frams held by springs in the seast way. Thousaing is done by moving the heat he will be the property of the plate of the plate of the plate of the plate of the plate of the plate of the plate of the plate of the plate of the plate of the plate of the plate of the plate of the plate of the plate 
In making positive duplicates on the film it is only necessary to reverse the position of the print from the positive-positioned negatives to make all three positive positive-positioned negatives to make all three positive prints evancide when bound together between two glass plates to form one harmonious transparent colored picture. The collodion positive film is so than that accurate registration of the three films is not

## WIRELESS TIME SIGNALING TO SEA FROM THE EIFFEL TOWER

#### BY F HONORE

The wireless telegraphic station of the Rife! Tower is now signaling Paris Observatory tims to all reserve within a reduce of 1600 miter. The present station is using 15 to 16 horse-power. When the new Installation whose completion was delayed by the record foods is fashabed 100 horse-power will be at the discount of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of th graph mean time to various centers in Paris and cidereal clocks which serve to regulate this seem time. The matter clock in question itself indicates mean time with reference to the meridian of Paris. Inclosed in a giase case and suspended from a valid or little that vibrations in measory and variations in tempera-ture cannot effect the mechanism it is corrected each any if mecessary by means of a magnetic requisitor. The rod of the pended and the property of the pended and of which be produce carries is magnet the lower and of which he produce are sufficient to the carries. end of which is spaced a rew minimeters from a soien old. Depending upon the direction of the current which is sent through the sciencid, the magnet is at irmeted or repelled thus retarding or accelerating the best of the pendulum. In this manner a lost second is regulated in thirty-six minutes.

is regulated in thirty-six minutes.
The clock is connected by wires with the key of the vipuless station of the Miffel Tower. At midnight sat 1816, and at 18 64, the clockwork automatically

But peculiarly these of national languages which render metal comprehension and international magnetification are the most carefully avoided.

The unpractical nature of the circumfaceal letters has been infected it may be remarked here how

The unpractical nature of the circumtersod iscurs has been indicated it may be remarked here how ever that in point of system Eansenhof s letters are very inferior to the similar cones employed in the Casch languages since the parallelism in sound between x and x and y is diagnised by the choice of letters. This produces a very amateurish

effect. Beside the familiar parts of speech which are in dicated by special terminations Mamenhof invented a new class characterised by the termination. su (box it was element) but the limits of this class which in cludes some but not all adverbs and prepositions are not clearly defined

are not clearly defined Many words attem from existing languages are disguised subdet after the fination of Velogich bodguised subdet after the fination of Velogich bodguised subdets after the fination of Velogich bodforman choiciers Rugilals responsed that French our

HOW LABOR BORD THE GOT APPEAR TO ME!

To the Editor of the Scurzyzz Arrica to May To the Editor of the Scurzyzz Arrica was to people how large the sun looks to them when it is in mid beaven and you will get ten different optisions of its size which range from a silver dollar to a cart wheel The varied opinions are due to the fact that there is nothing with which to com pare it when looked at by itself Before any acru rate estimate of its size can be made we must have some known object with which to compare it

Thus when the sun is on the he to be close to houses trees and hills it looks very large. To some people it seems as large as a hous or tree. Moreover there are more persons who will or tree moreover there are more persons who will agree that it appears to be a certain fixed size under this condition than will agree when it is viewed at the senith The diversity of opinion in the latter case results from the inability of the eye to size up an isolated object

isolated object. This has been proved by projecting a narrow beam of light on a perfectly black nor reflecting errors not light on the observer could see nothing but to beam of light and had no way of judging his distance from the across The observations of several policulater those conditions revealed the fact that there was no certainty about the length of the beam the apparant length being estimated all the way from a few inches to several feet. This being the case when the sun is in mid-beaver and the size he reflected to come autifura stand how can the size he reflected to come autifura attact.

and? The most logical narver is found by representing it is a sirele located at a fixed circular form the eye. The average reader belief the printed pass about one shall from his eyes when reaches 44 this distance his sign inclinate fairly clearly the clear of the fixed that is the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the con

an inch. These same men if asked to draw a circle on the sheet that would just cover the sun's disk if held between them and the sun at a distance of one foot from the eye would produce a series of circles of magnitudes ranging from a twenty five cent piece to

The real size of the circle should be only three ixteenths of an inch in diameter

The method of representing the sun s exact sire by

The method of representing the sun s exact sire by a circle one foot from the eye is simple. Take a smoked glass hold it one foot from the eye and scratch pin marks tangent to the suns link at the four quarters. When the diameter of the circle in closed within these marks is measured it will be

four quarters. When the diameter or turn view closed within these marks is measured it will be found to be very close to it re-electronates of an itself to their words it a circle of this size were drawn and in its areas were reproduced in prejoration to an exercise as not the observer would be able to extend the size of the size were related to the size of the foreign the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the size of the si foot from his eye could examine it will scrutiny that he could examine the full m naked eye Detroit Mich

# The Flights of Rolls, De Lesseps, and Curtiss Compared

BY CARL DIENSTBACH

The "beavior-than-air machine' during the past few weeks has proved nearly as useful as the large modern airship, that has aiready been commercialised. When liferiot first flew across the English Channel, sureplane Blériot first flew across the English Channel, suroplans traffic seemed near But as nobody, not even the rivats in that attempt, repeated the feat, his perform ance gradually lost its convincing quality. In Ger many his frast was dubbed a "more piece of good luck." But as nobody, not even his When, however, during the last few weeks, the Chan nel was not only crossed again on a Bieriot me

nel was not only crossed again on a Biferict machino, but in quick succession the whole navigable length of the Hadson was covered in a splendid high-speed flight, and when on the heels of that triumph the Channel was crossed and recrossed in a single flight, everyone resilised that the aeroplane had on tered upon a wider field of useful tered upon a wider nois of useful ness and that it was indeed a ve-blele which is destined to be the pleasure conveyance of the future. The three flights mentioned were all over established routes of the liveli est traffic They all required a ma-chine which would not fail, under penalty of falling juto the water, and they were all between rocks or and they were all between rocks or precipitous mountain sides, which made it a problem to land in case of emergency, and which influ-enced the air currents in a way as yet so little known that even as suphyr might become formidable. That they were successfully accom-pliable by machines of so widely different types as the District moneplane and the Curtiss and Wright biplanes shows to what extent the biplanes shows to what extent the technics of fying machine construc-tion have advanced within the past year. They capt-taily emphasise the immense propress that has been made with regard to the heart

the minonae progress that near the minonae information and the man of the minonae are an exceptance to make the minonae are the status of the acceptance motor of the automobile on gains It offers certainly a more territable problem, but it seems townshable problem, but it seems the minonae are townshable problem, but it seems failing of the card; slight motors was due less to the inherent diff. Stilling of the card; slight motors was due less to the inherent diff. Stilling of the card; slight motors was due less to the hard to hard to poisso. Hand to inexperience of a top-load—blan to inexperience of out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out that the Curties and a Bliefted out the still the curties are the still the curties and a Bliefted out the curties are the curties and a Bliefted out the curties are the curties and a Bliefted out the curties and a Bliefted out to be compared to the curties and a Bliefted out to be compared to the curties and a Bliefted out to be compared to the curties and a Bliefted out the curties are the curties and a Bliefted out the curties are the curties and a Bliefted out the curties are the curties and a Bliefted out the curties are the curties and the curties are the curties and the curties are the curties and the curties are the curties and the curties are the curties and the curties are the curties are the curties and the curties are the curties are the curties are the curties and the curties are the curties are the curties are the curties are the curties are the curties are the curties are the curties are the curties are the curties are the curties are the curties are the curties are the curties are the curties are the curtie power with which they were provided for these trips. They were not larger than the standard type but De Lesseps had a 50 horse pow or Gnome motor in place of the 24 horse-power Annani with which Bieleto free across, and Curtine also a 50 horse-power alght-cylinder motor against the usual 25 horse-power four-yilinder angine of a Curtin bilingia. Cant Rolls had Curties biplane Capt Rolls had made no attempt to double the mo-tive power of his Wright machine, hnt as he was flying alone he had considerable reserva force at his considerable reserve force at his disposal. These were all machines capable of carrying a passenger, but flying with only the pilot aboard. Consequently the motors not running continuously nn top-load any more than automobile motors.

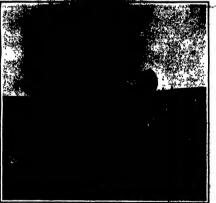

uer top-road any more tana automobile motors. Count de Lesseps used his power sparingly He made little better time than Bidriot. Even Curtiss, who was beating the "Twentieth Century Limited," says he rarely opened the throttle wide

There is another feature common to these flights, to which their success must be ascribed just as much as to more reliable motive power. It is the evolution of high flying. For trips of this nature a great clevation has the very obvious advantage of easy reckoning.

De Lesseps flow in a fog, yet, in contrast to Biériot, he
was amoet always in sight of land, at an altitude of
a thousand feet, as compared with Biériot's 306.

From the same superior level Curties saw the nonery From the same superior level Curtims may the scenery spread below him like a chart. He could make short cuts, pick his leadings, and easily decide where best to lay his course. Flying high greatly simplifies the plicits task, where low fiying would sad to the diffectities of balancing, the difficulty of following a more oless devolutes ourse while dedging obstanks. It means contecting like the strain on a figrade rider, who with his grea gives to a county read, then content to pick out a path. Though a fying pited does not hear actual content with objects below there will remains the need of allowing for heavey in stand of wind pusts, irregularities of the morter or awaying the machine. The principal actuations of being high is however, in the binoreased "ranges" it gives in dominating the six testif. ties of balancing, the difficulty of following a z

Rolls in his Wright

De Lemops in his Blériet monoplane flying across the Chantel. THE SECOND AND THIRD ADSOPLANDS TO FLY ACROSS THE EXCLUSE CHARMES.

Aviators are fast realising that it is better to en rial disturbances than to fight them. This tend aerial disturbances than to fight them. This prevent them from following any route that app the confined character of a roadway. The unfertured our mixed to see the control was seen to make the control to good as a carry irred to control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the control to the unfettered, can pick its path at any b

à patent first FUE AFF TETRICA.

à patent has just been haved on an improved type of thismle for me 'n fise openings. The thimble is a constructed as to be figure attached to the chimary and is provided with preductions adapted on continuous and the contract of the chimary and is provided with preductions adapted to chimary and in provided with preductions adapted to chimary and the province of the chimary and the point provided adapted to the chimary and the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of the contract of th

pumpind wheneve facilited by turning it before with-drawing its from the thimate. A sight modification derive consists in attaching the stimule to the sight of the sight of the sight takes the pince of the ener of as well as the new 7, The stree pinc is provided with tongues which are underent, forming grooves in which the spikes are necessive when the pipe is given a partial turn. The

IMPROVED STOVE PIPE AND TRIMBLE FOR PLUE OPRILITIES

pipe is formed with a bend edapted to engage the finage B, which forms a next electron case the pipe does not perfectly fit the thimbia. When the pipe is withdrawn, the opening may be closed by means of a cot O, which is provided with grooves B. His those out O, which is provided with grooves B. His those the pipe. The investor of this store pipe and thingle is Mr., Ambroon Y. Medelirk, of Devagpert,

haust These bubbles are readily discornible, and indicats the course which is being pursued, thus enabling the enemy to take measures for dense or a counter attack. In order to prevent a submarine best from betraying its course in this way, an investor has devised a method of retaining the exhaust gases, per mitting them to escape only at irregular intervals in

Brief Notes on New Inventions, sence of a submarine boat is sometimes to

The presence of a submarine boat is sometimes made known to the enemy by the train of bubbles that rise to the surface of the water from the gas-engine ex-haust. These bubbles are readily discernible, and

The pre

neeting Mr Dezter M Rogers, of Boston, Mass, has dedicated to the public an insec-destroying bomb upon tions of the property of the property of the client dry policious in produced form, and is averaged to be exploded when it reaches a criain height after intended to the companies of the companies of him, discharged from a sun The policious parties in this distributed in the air, and gradually settle down on the leavase of the trees which are infaced with the linects. This method of treating the trees poseases the advantage that the powder will peach all parts of the follows, and is applied with a great parties of time and about of supplied with a great parties of time and about on the contract of the con-

PATENTED ODDITIES.

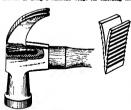

GUN BORN SHOUTHEN THE ARCOP.—A rather ingenismented of towling the sights of a gun has recently persecuted by a German inventor. It consists in place the telescope in the bore of the gun, with its limit

TELESCOPE FOR TRETIES GUN SIGHTS.

sight parallel to the axis of the bore. The sightly device is then set to its sero position, and the gun almost at a distant object. The evidence of the test scope, which is shown in the suberged sectional view, is fitted with a priem, so their the sait of sight intersects the lime of aim at the eye. In this way it to possible to make an observation by meetly moving the possible to make an observation by meetly moving the possible to make an observation to predict the possible to make an observation of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of th

ROSHING WESTER FOR TOST HANDLES—An inventor in New Mexico has recently hit upon the ingenious scheme of using a resilient wedge for fastening the

RESILIENT WEDER FOR PASTERINE TOOL BRADE,

heads of tools upon the headles, the advantage of this being that when the wood is compressed through the use of the tool, the wedge will expand, and thus autometically tighten the handle The wedge as illustrated herwith is split, and is provided on opposite faces with retchet teeth that serve to prevent its withdrawal from the wood. The tool head should also be formed with ratchet teeth inclined opportialy to those, or the wedge, so as to prevent the handle from being withdrawn.

withdrawn.

Am-Cocurse Fax—It is well known that the circulation of air increases the rate of evaporation, and thus cools a moist body It is for this reason that we use a fan to produce an artificial draught of air over the

ERLF-COOLING FAN.

face and absorb moisture from the skin. An inventor has recently hit upon the idea of improving the efficiency of the fan by providing it with a moist pad, so that the evaporation will cool the fan. The fan is made up of a rattan frame, as shown in the accumpanying drawing, which is covered with two layers of cioth, between which is a layer of felt. The cloth layers may be removed to permit of taking out the fall operated it will grow colder, by reason of the evaporation of the control of the control of the control of the control of the control of the control of the colder in the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the cont

# New Edition

first time you get a hrist time you get a Mark Twain's writne-half the price they hefore. This is a new edition, just as complete as the old one, which still sells, by the way, at \$50.00. The new edition is only \$25.00—for the 25 volumes.

\$30,00. The new edition to only \$3,00—for the 27 which has been Mark Twain's ambified to have his books is every American home, and he made a great personal acciffice to laring about this remarkable opportunity—for the first time in the history of publishing, copyrighted books are sold at the price at mor-copyrighted books—the chance will not come again.

But for Mark Twain's action this would have been impossible. Never before has a copyrighted library set of a standard author works been issued at such a low figure.

## His Complete Works-25 Beautiful Volumes

render Matthews says: "Mark Tvain will be included in that gr is beaded by Moliker and Cervantee With the exception of all in, Twais was the greatest of a certa modern worker, such was a form to posterny through the property of the pro-teed of the posterny through the property of the pro-teed of the property through the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the property of the pro-teed of the property of the pro-teed of the property of the pro-teed of the property of the pro-teed of the property of the pro-teed of the property of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the pro-teed of the proteed of the proteed of the pro-teed of the proteed of the proteed of the pro-teed of the proteed of the proteed of the proteed of the pro-teed of the proteed of the proteed of the proteed of the pro-teed of the proteed of the proteed of the proteed of the pro-teed of the proteed of the proteed of the proteed of the proteed of the pro-teed of the proteed

ents, Nordmann's method, in con ction with the spectral analysis of erative stages of development. These bigh temperatures explain the fact e reveals the existence only of ele-ts like hydrogen, nitrogen and carand the compound of carbon and ogen called cyanogen, which is in

ciable by heat. rdmann's apparatus also many new prospects in photometry, a many new prospects in photometry, a management of the infancy, ex t as regards the sun, although the ex measurement of stellar radiations measurement of stellar radiations, is an in spensable prerequisite to the knowledge of the constitution of the stellar universe if the constitution of the stellar universe otherwist past at Petsdam, Germany, in determine the production of the stellar production of the stellar production of the stellar production of the stellar production of the stellar production of the stellar production of the stellar production of the stellar production of the stellar production of the stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar production of stellar produ seers have thought less difficult to follow than it really is In determining stellar magnitudes, the American and German observers meraly meanined with the photometer the total iuminosity or seeds photometer the total iuminosity of each star, but, as the stars are of different colors, the values thus obtained are af-fected by errors of physiological origin Furthermore, it has long been known that estimations of the brightness of variable stars, especially red stars, ex-hibit great individual differences. A com parison of the catalogues of Harvard and Potedam shows differences in the recordad brightness of red stars if in or red star to that of a white star is repre red star to that of a white star is repre-sented by E, it will be represented in the other catalogue by 3/2E. These system atlo differences appear to be due to two distinct causes. The first source of error is purely physiological and consists in the fact that sensations of color are pro-duced by the excitation of the termina filaments of the optio nerve, which line the retina, and which are of three differ ent sorts, sensitive respectively, an ent sorts, sensitive respectively, and al-most exclusively, to rays of the red, the green, and the blue and violet portions of the spectrum. Now this relative sensi-tiveness varies greatly in different indi-utipals, as is strikingly illustrated by the entreste and pathological case of Dalora-lam, or color blindness. The luminous size, or color blindoses. The lumipous amination preduced by a given star, that is to say, the aggregate effect, impressed upon the filaments of the three different Ruha, differs in different individuals. The second cauty of error is found, apparently, in the phenomenon discovered by Parkinja, which may be expressed as a filament of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the colo generaty, in the phenomenon discovered or Publishes of Publishes of Publishes of Publishes of Publishes of Publishes. If two natures of tight, one him and the other red, appear equally bright to the aye, and if the brightness of each power in the dispination in the same proportion, the red light will appear loss plant time, the light, "The regular is tight, and the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of the same property of th

star and the aperture of the telescope Additional complications are introduced by the age of the astronomer, the position of his eye in respect to the eye the degree of ocular fatigue, etc. eliminates these errors in the determina n of the total luminosity of stars tion of the total luminosity of stars. It makes possible an exact study of the colors of stars and of the dispersion of light in interstaller space Finally, it will undenbiedly give information constrange and mysterious transformations of variable stars of all classes

A Morms-Warming Service for Aeronautz, Dr Franz Linke director of the Me-teorological institute of the Physika-lischer Verein at Frankfort-on the Man, has published a report on the special storm-warning service that he organized last summer in connection with the inter service, being the first of its kind, was exportmental, but proved so successful that a similar undertaking is likely to be a feature of all future aeronautical rompetitions on a large scale, especially if held in a region of frequent thund

The prediction of large general storms services that now exist in all civilized countries Local storms, however, and ospecially thunderstorms, are notoriously difficult to forecast on the basis of the widely scattered reports that make up the ordinary weather man and that are all that the forecaster ordinarily has at hls command The attention of the Frankfort service was directed especially to the prediction of thunderstorms. The life history of these storms is now well understood thanks to the hrilliant in vestigations of a small group of me-teorologists of whom M Durand-Gréville is the most conspicuous in the great majority of cases they sweep across the country in a long line that may be compared to the front of an advancing army

pared to the front of an advancing army
—the "thunderstorm front"—at a speed
averaging, in Europe, about 40 kilometers an hour The line of advance kerns
a position more or less parallel to itself,
and its progress is not difficult to predict, if its oxistence and position are known at any given time The prerequi-sites of successful thunderstorm predic-tion are a dense network of reporting stations and a system of adequate tele graphic communication with the central

five observers constituting a pickel line of 150 kilometers radius around the city of Frankfort. These were mainly reof Frankfort These were mainly re-cruited from among the volunteer ob-servors already reporting, but not by telegraph, to the existing meteorological institutes of Southern Germany. These persons were requested to send an 'ur-gent' telegram to Frankfort whenever a thunderstorm or a wind-squall (which is first-cousin to the thunderstorm) ap-peared in their vicinity between the hours of 7 A M and 7 P M The compensa-tion offered was a free entrance ticket to the exposition and a copy of the pub-lished results of the experiment

The result of these arrangements was most gratifying, as, with one or two exceptions, all the thirty-seven thunderstorms that reached Frankfort during the three months of the exposition were duly heraided an hour or more before their arrival

It is noted that no air-raft attempted to fly in the face of providence—and the weather forecaster—except the big Zeppelin," which began its famous voyage to Cologne against the advice of the foreaster and promptly ran into a heavy thunderstorm.

The entire cost of the service was only 600 marks (\$150), an insignificant amount compared to the value of a single large airship, to which, as well as to the lives of aeronauts, an effective stormwarning service accordingly offers a cheap form of insurance

### THE OPEN DOOR OF AVIATION

dissilving the injunction granted in favor of the Wright brothers against Cuttles, by Indge Hazel and the summar injunction granted by Indge Hand against Paulban the Cheuft Court of Ap as als has simply followed a long established precedent or material has As a seneral rule prefinitions before tions are not countriumed in patent case even lower fellowals. The reason react ha to seek. Barely indeed as intringement so charts established that a court is fustified in restraining the minoriacture and use of an invention tefore the question of patent valid D preliminary injunctions were granted without entering into the question of validity many an house refinients linshings would be ripped mill after

The hardship which results from the great a read between to use therety tituatented by this very injunction which the Wrights obtained against and Latiben As a result of the interlocutory decrees and I-aillian. As a result of the interlocutory decrees of indiges Hand and Haze'the Wright brothers have controlled flying in this country for the last six months. Unless he filed a bond with the court, no aviator who used a machine equipped with alterous or wing warping devices operated in conjunction with a vertical radder could make sell or fi) his appa-cution in this country. It is far from our intention to censure the Wright broilers for the attitude which they have taken. They are in every way justified in seeking to uphoid their patents and in defending tights which unestablished as they are as yet from a legal point of view are nevertheless the truit of pains. legal point of view are nevertheless tha fruit of pains-nking experiments extending over years. Probably the counsel of the Wright brothers themselves were as much astonished by the willinguess of Judges Hand and Hasei to grant injunctions against Curthes and Paulhan as the patent profession at large Curties at least was a successful sylator before the Wright brothers decided to (sat saids all secree) and to show the world what manner of machine was that of whose performances they had darkly hinted Biériot, too, had been pluckily experimenting for some time before the Wrights flew in public Curiss was using hinged wing tips in his earlier machines with which he made public flights antedating the open flights of the Wrights. It is asionishing that the lower court should have failed to find in these facts a sufficient onflict of evidence to deny the granting of an in

With the reversal of the decision of the lower co by the Circuit Court of Appeals, the develop a lation in this country is now unhampered I Sommer, Biériot De Lesseps, and the rest daring company of French serial pilots, whose an ploits entiren the press dispatches simost every day, are now at liberty to enter this country and fly without the fear of finding their hands and their machines ried by a sweeping injunction Moreover, American inventors will have the opportunity of improving exinventors will have the opportunity of improving ca-leiling machines provided with wing warping devices, without fear of incurring a fine for contempt of court Much as we should like to see justice done to tha Wrighls, we cannot but feel that the reversal of an injunction granted contrary to established precedents will be viewed with satisfaction by every aar

THE SCIENTIFIC AMERICAN ARRONAUTICAL TROPHY. PART from the value which will attach to the Schwiff Ampsicat seronautical trophy as indicating that its permanent owner has in three different years made the longest flight in the United States, the trophy will possess a strong historical and sentimental interest as being absolutely the first prize of any kind offered in America for the encouragement of the art of aviation.

in this respect the trophy must forware be using among the counties cups and prises which will be offered in increasing sumbers during the years to come Cups which are won year by year for certain special events and pass into the permanent owner ship of the whomer possess a valua and interest which, however great at the time, must necessarily become local and personal as the years po hy, but a trophy which carries the distinction of being the first to be offered in that early period of doubt and strength which have a beginning to the contract of the which have a beginning the contract of the con-tract of the contract of the contract of the con-cess a value at it were which will inertiably increase. sess a value all its own, which will inevitably increase e ispse of time

in this connection, we wish to draw the attention of intrants for the forthcoming long-distance, cross-com try flights, for which such generous prises have been offered to the fact that upon their sending a letter of notification to the Aero Club of America their Pights will needed official recognition and if the dis-lance covered should be greater than the seventy to sevent) five miles (official distance now under consid intian) flown by dir Curtiss between Alb Pongbles ask, that contestant unless lits record sh is surpassed before the close of the year will be the close of the year will be the close of the year will be the strance fee or expense of any kind attached to such un cutty the sending of a letter similar to that by Mr Culles which was published in the Still title Animax of Inne 10th 1910 being all that is neces

We wish moreover to take this opportunity of cor ecting the rather with spread impression that the cup must be won three years in succession. As a matter of fact there is an stipulation of this character tild If a contestant wina the cup three

## THE INTERNATIONAL UNION FOR CO-OPERATION IN SOLAR RESEARCH

F a scientific critic were called upon to mantion one of the most striking and important features of modern astronomical research it is quite likely that he would refer to the apirit of organised and practical cooperation which is manifested by observatories and astronomers. By evolving anitable plans for joint efforts to enable each institution to do plans for youte source to enable such institution to do the work for which by equipment and position it is best suited, and by assigning through common agree-ment the particular part to be played in any given campaign, increased efficiency is secured, uncleas dupil cation is prevented and the entire project under prose-cution can be advanced symmetrically and rapidly. rution can be advanced symmetrically and rapidly. The photographic chariting of the heavens, the obser-vation of transits and total solar cellipses, the study of the variation of latituda, and the investigation of the shape and mass of the earth, are a few familiar instances of valuable cohperative effort by astron-

More recently there has been an attempt to secure similar harmony of effort and coliper a similar harmony of effort and coliperation in the atudy of the aun, and in 1904 at the initiative of Prof. George E. Hala, director of the Mount Wilson Solar Observatory of the Carnegia Institution of Washington, there was formed among the visiting astronument at the St. Louis Exposition an International Union for at the St. Louis Exposition an International Union for Coloperation in Iolian Research. In this following year this Union met at Oxford, and in 1907 at the observation of Mendon in France. This Payer, on Appara 59th, the members of the International Union will assemble at Mount Wilson, California, as the greets of Prof. Hale and the Soine Poservatory of the Garnegie Institution. This meeting aboutd prove Unique and measurable, for it may be doubted whither there have seve been assembled so many eminent entropements astrophysicists interested in solar studies as the who have accepted the invitation for the Nounb Will

conference: That such a indirectar in farmily presented out the fellocates allevious to seize solution of the fellocates allevious to seize solution of Prof. light and the sharevering? the direction will be admissed be despited, but of it time these distinguished servonemers and ph will be said to searching the timestree this that institution and its novel and powerful instrum se of which several new chapters in our in of solar phenomena have been written and still other iscoveries, especially in the field of stellar evolution com destined to follow

removed to follow the control of the visiting scientists who never better have made the pligrimage from Passdean up the alopse of Mount Wilson the work of the Solar Observatory is familiar from accounts published in acientific pariodicals. No one is more welcome before European astronomical societies than its distinguished director, who whenever abroad is siways called upon to describe its progress Therefore, it is not aurprising that when the opportunity was afforded, some fifth representatives of important astronomical observa ies and his sical interatories should decide to cross the Atlantic Ocean and the American continent to see and hern at first hand of work in which they are intimately interested. While it is a source of intenses gratification to Americans that the Mount Wilson Or-severatory has become so pre-eminent in the brief space of aunu six vears, yet it must be remembered that colar astronomy and astrophysics are presecuted with viscor at other institutions and by numerous astronom it is this circumstance that makes of importance the coming meeting of the International Union

The value of solar work may be appreciated when it is slated that the dry season at Kodaikanai in Southern india where there is maintained a large ob-Wison when of course the regular daily photographing of the sun is out of the question. With proper animpements therefore, it, is possible to obtain a conlinuous photographic record of solar phenomena from one stallow or another on the earth's surface Likewise tin visual observation of the sun-spot spect is definitely apportioned among various observers, so that each group receives a portion of the spectrum for thorough simily, the results of the various observations being recorded on a common plan Again, so impo in modern solar research has become the use of spi heliograph whereby the sun's surface or limb is photo-graphed in light of a single wave-length, according to certain deficite arrangements, that there is now an important chain of observatories from India across Europe and America to the Pacific Coast, where these Birrope and America to the Pacific Coast, where these instruments are in daily use. To record the amount of the sun's radiation received at the earth's surface, bolometers and other heat measuring davices are ployed at various stations and continuous records are ployed at various stations and continuous records are ployed at various stations and continuous records at kept. In many case it is quite obvious that local conditions may affect the observations and the records. Accordingly there must be almultaneous observations at a number of stations authorities over as long periods at a number of stations authorities over as long periods. of time as possible. These are being secured with ever greater efficiency by the members of the International Union for Cooperation in Solar Research. h cooperative action is not intended to destroy insuch conjecture action is not infended to destroy in-tituitive or originality in any observatory or nation-omer, but rather to encourage it. To-day a large number of observers are engaged activaly in solar research, and in no dapartment of astronomy is a greater amount of progress being made. This is all the more striking as it was only a few years all the more stricing in the stricture of the stricture of the sun had almost been relegated to that limbo from which nothing new can sver come

Some interesting communications relating to the general study of the aarth were presented to the International Geodetic Association, which me in Incode to the September, 1909. Mr. Austin Mohart Clark, an accepted authority on crinoids, has recently published two papers in the Proceedings of the U 8 National Museum The first of these papers, No 1740, is "On the Origin of Cer-tain Types of Crinoid Stems" and in which he dis-cusses the probable relationship between the column climates the processor relationship between the columns of the crinoid and the central or sur-anal plate of the schinoid, and how widely different types of columns may be reduced logically to a primitive common ancestor Among his conclusions from the evidence he presents is that the stems of the recent and most of the fossii crinoide may be derived by supposing them to be the homologue of the central plate of the crinoid echinoid ancestor which has graduelly become thickened and elongated and developed fransverse alternat ing fractures which have metamorphosed into definite articulations. The second paper No 1743 bearing the title "A New Australian Crinold," is a description of a new species which he calls Compson tra la and which was obtained at Port Jackson, New Waies, by Mr J Bracebridge Wilson in the summer

The late Prof Garriott, of the U S Weather Bureau was working at the time of his recent sudden death on a very promising method of long range forcessing, based on the observation of departures from normal pressure in which separate regions of the world Telegraphic reports of the pressure at European and Astatic sations are received every morning in Wash-ington, and wave mittiesd for this purpose. The study of 'correlative meteorology—1 o, the interrelations of atmospharic phenomena in parts of the world far remote from ona mother—is now occupying the seri-cua attention of meteorologists in all countries, and is one of the two satient features in the recent develwas working at the time of his recent sudden death on attention of meteorologists in all countries, and is one of the two anient features in the recent devel-opment of their science, the other being the expira-tion of the amoughney by means of kites and balloom. An international commission was recently organised, note the presidency of M Lodo Pisserence for for the purpose of maintaining a world-wide tel-tor the purpose of maintaining a world-wide tel-tor. The purpose of maintaining a world-wide tel-tor that the foreign of the commission can be realized, the foreign of the commission can be realized, the foreign expiration of the com-ditive without many semi-recinit the whole world, instead daily weather map embracing the whole world, instead a single country.

# MODERN STEEL LOCK BAR PIPE CONSTRUCTION

BY FRANK C. PERKINS

In considering the use of steel pipe as compared with cast from pipe, it should be remembered that they value of water pipe depends on carrying superior, strength and durability as well as cost The accompanies illustration Fig. 3, above 45 limb lock har pipe lying in a trench at Philadelphia, Pa., while the details of construction are noted in Fig. 3 it is held that the cost is about 5 per cent more than riversid that the cost is about 5 per cent more than riverside. pipe, but it has greater strength and carrying capacity

it may be stated that this capacity depends on friction, and riveted pipe presents an obstruction at er rivet and every circular and longitudinal seam.

rivet and every circular and longitudinal seem. It is also claimed that the uniform section of the lock bar pipe without any obstruction of any kind from end to end of each length of pipe, materially reduces friction. Some engineers say the carrying capacity of lock bar pipe is from 10 to 18 per cent greater than riveted pipe or is equal to well-coated, veil laid iron pipe
Tests on 30 inch pipe at Lockport, N Y, in 1909,

Treas on authen pipe at Lockport, N Y, in 1999, aboved a friction loss less than that given by Wat son's Tables for cast-fron pipe It is well known that steel pipe is materially stronger than cast fron pipe During a cloudburst in 1903, two 48 inch rivated steel pipe lines carrying 50,000,000 gallons per day for Newpipe lines carrying 50,000,000 gallous per day for New-ark, N J, were undermined and left unsupported for four days for over 35 feet, and in addition to the wight of the pipe and the water passing through them (about 15 tons), there were some thirty up-rored trees piled up over the pipe which supported this immense weight and pressure, without damage. It is conceded that cast iron is brittle and treach

crous at best and though apparently sound one day, may prove defective the next, and break without a oment's notice

It is of course true that the strength of any steel

Fig. 8.—LOCK BAR STREE FIFE, TAPER JOINT.

Fig. 1.—LOCK BAR PURE OF INCIDED DIABETER IN

pipe is equal to the ptryingth of the joints. Bingle riveded joints have an effective of about 16 per cost, double riveded joints about 65 per cost, triple riveded double, buttering joints about 65 per cost, and welded double, buttering joints about 86 per cost, and welded joints about 86 per cost. Lock har joints have a effecting of 100 per cost, and have greater strength. than pintee themselves, as all touts result in a fallers than piates themselves, as all tests result in a fullers of the plate, Without injury to the joint. A 48-hah diameter 7/14-inch plate lock her pipe was tested to 1.669 pounds pressure, and the metal of the plate was stretched 4½ inches with neither injury to the lock her joint nor the least testage along the same. Fur-ther pressure was impossible, because of the blooking out of the rivesed reinforcing and at the land and

out of the rivette removes.

It is maintained that look har pipe is from \$0 to \$0 per cent stronger than riveted pipe and 10 per cent stronger than velocity pipe, and superimon has shown at the per cent stronger than welled pipe, and superimon has shown and ind is fully equal to that of east-from pipe.

Without donkt the life of all metal is less than it was twenty years ago, an ownskays electrolypia, at phorous send, galvanie action and other squate greatly excelerate correction. It is therefore most difficult to compare the life of pipe laid within the last twenty years and pipe laid prior to that time, because of these constantly increasing corrective influences.

According to experiments on the reception of radio-telegraphic signals when transmitting with a spark gap in compressed air, as compared with signals re-ceived when an ordinary spark gap was used, there appears to be no advantage in using compressed air for this purpose. While the dielectric strength or the air is emormously increased, so also is the resist-ance to the cellilatory spark, both appearing to in crease in about the same ratio.

# THE WEARING OH

Manganess steel is by no means a new material, but its application has been slow because of the diffi-culties which manifest themselves in giving its final form. It seems to have been discovered by Hadfold's Relei Foundry Company, Sheffold, Regiand, some direct or forty years ago, when seeking a hard and cough substitute for steel when used for catchings it was found that the mere increase of carbon in the steel did not have the desired affect. Steel having a carbon content as high as 2 per cent structure of the steel was increased with the steel and the steel was increased. fully tried it was known that when the manganese content of a steel somewhat acceeded 376 per cent, the alldy would be brittle. What was not known and what the Hadfield Company found out was that if the manganese were increased to a point ranging any where from 7 per cent to 20 per cent a steel might be produced which is remarkably strong and tough be produced which is remarkably strong and tough Now this reversal of a leading property of an alloy by merely increasing the proportion of one of its con stituents is, as R A. Hadfield pointed out, not with In forming alloys of copper as the resultant alloys seem to become harder and more

the resultant alloys seem to become harder and more brittle as the time contain rises from a low point up to a considerable percentage say 35 per cent, but when more the is present than the soft and fough copper, the alloy becomes softer. It was early found, however, that manganese steel was a vory retractory metal to machine. The proper ties of hardeness and toughness produced a combination that was very successful in resisting the cutting of the contract of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the combination of the c bigs-speck steem capable of enormous performance when used against the pure carbon steels and east from. But manganese steels still hold out. Almost the only practicable thing to do is to use the grinder. Now the grinding machine is of late become a strong complettor of the ordinary machine tool. But its development has hardly been carried far enough to stable ment has hardly been carried far enough to enable it to handle commercially the multiplicity of cutting constitutes necessarily operations necessary to enable manganess steel to have a general application to all the purposes for which it is highly adapted. Further, it has been found

difficult to roll
But sò great are the intringic capabilities of this
neaterial for certain uses that, in apite of the difficulties of giving it the dearfer form, it has been parity
rapidly acquiring friends. Consider, for example, the
case of the Borton Hersted Railway Company This
corporation operates its transportation gystem on a

wing extraordinary wearing qualities of mangazese strei rails.

by Prof. Cohen. by Frof. Cobies.
The dissess studied by Brdmann and Fritssche is designated by Frof. Cobies as tin pest. The metal thus affected weells in spots, forming ward like blatters, from which small drops issue and hang supended in very much the same smaner that drops of sulfastives will achieve to polished copper coins in the further propries of the disease, the blatters be-

ne larger and the metallic on disappears more and more The interior of the mass is affected last, as can be shown by sawing through the metal whose sawing through the metal whose surface has become quite duli When the entire mass has been transformed, it crumites read-ily, and consists partly of a granular powder similar to anuar powder atmiar to ad, and partly of more or less consistent fibrous lumps of all sizes up to that of a fist. When a piece of tin is cooled artificially, the modification appears first at isolated spots, from which it ed spots, from which it spreads in wart-like bilsters and later forms a columnar struc-

n of cold is distinctly gray,

action of cold is distinctly gray, the upplication of heat produces a remarkable change. Even by merely covering it with hot water, the dark gray color is lighter, approaching that of ordinary tin. The change is due to the temperature acculatively. If a specimen of powdery modified tin is heated in a closed reesel by means of a water bath, it not only assumes a lighter color but decreases in private the remarkable of the color but decreases in private the remarkable or the results of the color but decreases in private the results or the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decreases in the color but decrease point of mercury, it again b

it was before heating If modified, tin is heated to it was before heating it modified, tin is heated to fusion, an appreciable proportion will remain in the exidised state. The molten portion will upon solidifi-cation assume the appearance of ordinary tin, and to cooled to a low temperature, it can be transformed

Brass kettle correded by the wrought metal

again into the gray modification. Ordinary tin has a specific gravity of 728, but gray tin is considerably lighter, having a gravity of only 575 Prof Cohan directed his attention at first to determining the temperature at which ordinary tin is

the fast, stated above, that the two terms of the have different specific pravity. The apparatus employed is very similar to an ordinary thermometer, except that the capillary tube fapon at the top. The tower part of the bulb is filled with gray tin, the upper part of the bulb is filled with gray tin, the upper part of the bulb is filled with gray tin, the upper part ratus a portion of the capillary tube with a liquid insert relatively to tim, such as pertoion. The appratus facts to a temperature (aary 18 deg C) as for degrees above the probable critical point, so that a portion of the gray this is transformed into the watte variety. Then the apparatus is hope, for the periodic probability of the periodic continuation of the periodic continuation of the scale hope of the periodic continuation of the scale After a few minutes.

noculation with wrought notal disease. Antique coffee pet perforated by the fin Results of incents

transformed into the gray modification, the results transformed into the gray monograph, the resultance of the obtained by former investigators differing validity, some having found 36 deg (Contigrade) as the critical point, others 100 deg, etc. Fritza-hofs apperiments indicating that the transformation was enablicating for reversible, it was to be expected that there would be a definite temperature at which the trans-

ical point must be above 15 dec.
C. By successive operations a gradual approach to the critical print is obtained by working at tomperature alter-nately above and below said point, and when the limits have been restricted sufficiently, interpolation is resorted to This method also showed that the critical temperature must be in the neighborhood of 20 deg C. temperature must be in the neighborhood of 20 deg C, and careful determination proved it to be almost ex actly 18 deg Centigrade (about 65 dog Fabrenbeit) Since all tin utensits employed by us are made of the white modification, it follows that they are gen-

the scale After a few minutes it will be found to have fallen a w millimeters thus indicatis

that 21 dog C is still above the critical temperature, for as long as the formation of white tin continues, the mass of tin con-tracts in volume, owing to the

greater specific gravity of white greater specific gravity of white tin The temperature being then kept constant for a time may at 15 deg C, observation will show a rise of the petroleum column,

thus indicating that the volume of the tin has increased by the

formation of the specifically lighter gray tin, so that the crit

formation might proceed in either direction. Frot Coben employed two independent methods for determining this critical temperature. One, an electrical mathod, consisted in bringing two separate bodies of gray the into a vessel containing a 10 per cent solution of chlorostannate of ammonium. The two bodies of the are connected with an apparatus permitting the experimenter to observe and measure any electromotive force arising in the cell. As iong as both bodies are of the same temperature, there is no electromotive force, But if one of the timb bodies.

is given the temperature of boiling water, and the other that of cold water, the heated body is transformed into ordinary white tin, while the cooled body romains gray The electromotive force manifested formed into focusar, and formed into force unsuffested under these conditions was measured at different temperatures. At about 20 deg C the electromotive force was equal to sero, indicating that the critical lein perature is in the neighborhood of 20 deg C. Prof. and that the reason of the chiprostanperature is in the heignormous of a vege of the chlorostan-nate of ammonium solution accelerated the transfer-mation considerably, in both directions The other method was a volumetric one based on he fact, stated above, that the two forms of tin have

the best of flower the three wests and indeed

Motal injected by tin port. CONTACTOR DISEASES OF METALS. .

Infected sheet tin from Retenburg (ity Hall.

erally in an anetable compared and liable to be trans-formed parily into the gro variety, except on days when the temperature exceeds 65 deg Pahrenheit. The second method described above was also util-ized to ascertain at what temperature the transforma-

tion becomes

lises to assortian at what temperature the transformation of white tin into gray tin proceeds with the
greatest rapidity and this was found to be the case at about 48 deg. Centigrade below zero (about 54 deg F

An interesting discovery was that the transforms An interesting discovery was that the transforma-tion is heatened considerably by the presence of a few particles or "germs" of gray tin it follows that if an "infected" piece or object of white tin is left to itself at temperatures below 85 deg. Fabrunheit, the transformation will proceed constantly and with in-creasing rapidity, for each particle of gray tin, as soon as it is formed, becomes a new germ accelerat-ing the transformation Prof Cohen has given this phenomenon the name of tin pest in view of the germ like or infectious action of the gray tin particles, and also in view of the fact that the tin so attacked is practically ruled, since the restoration of the by meiting is attended with great losses owing to the sirong oxidation which takes place during the heating on account of the finely divided condition of the

The formation of histors during the conversion of the tin into the gray variety is a natural consequence of the increase of volume, since gray tin is about 35 per cont lighter than white tin

The articles which have been exposed to low temperature for a long time, say several construction, proceeding the activation of the articles are supported to exhibit a maximum of deterioration. This is indeed the case, as has been proved by the condition of antique tin vases, medain, and other objects due up in our time? In maximum, too, the deterioration of tin articles has been observed frequently, but the cause wean tou understood and no remedy was known. In the light of Pref Cobern's discoveries, the remedy is simple we have only to see to it that the articles are never exposed to choose discoveries, the remedy is simple we have not to see to it that the articles are never exposed to have the control of the articles are never exposed to have the control of the articles are never exposed to for the company of the control of the articles are able been reported, the articles had been exposed to low temperatures during the writter. distance from the center of infection R. you Hase-WHOUGHT METAL DIRE distance from the center of infection R. von Hass-linger thought that the phenomenon was due to crystailisation, and continued his experiments, showing that the modified tin had a lower melting point than the original metal, about 205 deg Centigrade instead of 232 deg He also found that tin foil infected on one side would become modified on both sides. Other experiments made by him, however, seemed to indirate that the crystallisation theory was erroncous, and he published the result of his observations with an acknowledgment that he was unable to account for them An untimely death having prevented von Hasslinger from concluding his investigations, his teacher, Prof Guido Goldschmiedt, of Praguo, drew Prof Cohen's attention to the unexplained phenomena and suggested that he continue the research Prof Cohen repeated von Hasslinger's exper-

and verified them in many ways. He ascertained that the small lead contents of the tin would in no way be held responsible for the result. He first believed that the phenomena might be explained by the forma-tion of the rhombic modification of tin which is un stable at temperatures below 161 deg C, having a tendency to resume the normal tetragonal form. If this hypothesis had been correct, the phenomena should have been absent at temperatures of 161 deg. C. and above Experiments, however, showed that the transabove Experiments, however, snowed that the transformation into the new dull powdery form of tin took place at 184 deg. C even more rapidly than at lower temperatures. This hypothesis therefore had to be

abandoned Prof Cobes then turned to another explanation, based on two well-known facts. First, that a metal which has been subjected to a tennile or to a conspeciation strain (such motal being designated as "mycoughe mptal" by Prof. Cobes) has an electrispic designation of the professional strain (such motal being designated as "mycoughe mptal" by Prof. Cobes) has an electrispical strain of the professional strain of the p

has not been subjected to mechanical forces; meaned, that several metals, its among others, have the preju-erty of recrystallization, that is, of exphilting a growth of their individual crystal grains, more pa-sicularly at high temperature. It is well known that two spacimess of "wrought metal" are sufform shoulterly fenitived in an understa-tive second of the present of the second of the con-traction of the second of the second of the con-tent of the second of the second of the second tion of "nawrought metal". This tandency, slight at confiner temperatures, outsit theseestably to these confiner temperatures.

condition, having a tendency to return to the constitution of "mavrogati metals" This tendency, slight at ordinary temperatures, ought theoretically to be strengthened by an increase of temperature that the contact of the content o Another experiment consisted in applying to a moiré plate auch as mentioned above, some powdered inferted tin foil and on top of this, a polithed plate ned sheet from Heating to 100 deg. C caus of tinned sheef from Heating to 100 deg. C caused the pollahed plate to be affected immediately, while the moiré plate remained unaîtered even aftar 14 hours. It follows that "a rought tin" (rolled tin, tinned

it follows that "srought tin" (redied Un, tinded Un, tinded beeckinn the full) must be considered an unstable product, in process of recrystallization. The form which is stable as ordinary mangestar, is the gray "I, but the transformation is extremely alow at such temperature within certain limits, an increase of temperature increase the registry of transformation Contact (Incondation) "AID, they may apply the management of the transformation of the contact the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the contact of the conta

particular conditions. Similar effects of con partecular consequence comman executives corresponding were observed on knew door handles, and Pref. Cohen also thinks that "wrought metal disease" accounts for the peculiar designation of the rolled lead roof of a acid factory The temperature of from 40 des C to 60 deg C., to which the roof had been exposus very favorable to the recrystallization process

To the Editor of the Sunsarrie American:
Relative to your suggestion, regarding the new word proposed by Mr. Wood, namely, "mechaniquistac," it seems to me rather complicated, and I would suggest that the more homely term, machining or me

gost that the more amounty term, machining or machined, would be far more appropriate in the application which he suggests.

E. W. Moonred.
Whatebury, Conn.
[The term mechanipulate does not rafer to the "machining" but to the mechanical handling, 1 e., moving, placing, centering, etc., of a piece of work,

SIVING THE APPRABANCE OF RELIEF TO PICTURES.

To the Editor of the SCHRETPIC AMBRICAN'
A simple method of giving the appearance of relief A simple method of giving the appearance of relief to pictures can be seen by the experiment that if a sheet of glass with minute cylindrical fluting on a side held against a photograph, with the series of finise vertical, be viewed through, the dispersing light gives the picture a stereographic effi-

solidity.

The utility of a minutaly fluted dispersing picture cover glass screen therefore can be shown, which is caused by the semicircle dispersion by the cylindrical fluiss of the light that is reflected by the photograph.

The determining factors are the minuteness of the fluting and the position and the thinness of the

ing acrem

The dispersion of the light by the refraction through these adjoining fittee of this stereoscopic acrem probable to each eye a different appropriate view of the picture, which produces the impression of solidity and depth.

the taking the height, he statisted as allittled of 7 500 feet in 7 minutes. It took him a half hour to reach the respect height. He descended in critice the same as when he sacended, and when within a hundred feet of the ground, he shit of the motor and date shit of the same and the shift of the same and the shift of the reach and the shift of the reach and the shift of the reach and same and the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift of the shift o

course. There was very little firing this day on account of the wind.

The third day of the neet Brookins again attempted to make an altitude record, but only succeeded in reaching a height of a little over 1,700 feet. After the unaberformance of the five Pringith Highners, Owville Wright made a flight in which be performed numerous and daring evolutions over the trees in the surrounding fields. His masshine flew very stendily and made sharp turns, but did into above the additional made and the surrounding fields. His masshine flew very stendily described the Hamilton exhibited in his Ourties hiplane at "bilencies."

Signols.

On the fourth day of the meet aviator Brookins well think, centle Orville Wright in the fancy maneuvers of givented and in the sharp turns he made. He creathe appreted and in the sharp turns be n

ed a new world's record for turning by making two turns in 6 3-5 and 6 1-5 seconds respectively. The circle he described was less than 150 feet in diameter, The best previous record of this character is said to have been made by one of the Wrights recently at have been made by one of the Wrights recently at Dayton Brooking again attempted to break the alti-tude record, but only succeeded in reaching 1800 feet after a 46-miles assent. He required only 10 miles acro-planes were frequently fright coptender during the aero-planes were frequently fright coptender during the aero-planes were frequently fright coptender during the aero-planes were frequently fright coppeted during the aero-planes were frequently fright copped when for was and wright machine suddenly scoped when he was a bright of 300 feet. He glidded down in a straight time and landed to a field out to altisance away

and landed in a field quite a distance away
On the fifth day, Brookins again attempted, and this on the BITA day, Brookins again attempted, and this time successfully, to break his altitude record After soaring in wide circles for 40 minutes, he reached a height of 4,693 feet. The machine was but a speck in the sky and on account of the base and the lateness of the sky and on account of the base and the lateness of the bour, it was sometimes momentarily lost to view After apparently howering for several minutes, he began a low descent in wide circles. Froothing circled five miles to the east of the motor speedway and gradually closed in upon it. He add difficulty in seeing the track because of the gathering darkness The motor dropped when he was only last way down and he was obliged to make a long gittle. He finally leaded he was obliged to make a long gittle. He finally leaded in a farmer's area couple of miles from his eating part of the state of the control of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of th has yet been made

Indianapolis aviation meet did not draw the crowds anticipated This was doubtless due to fact that only one make of seropians was used

fact that only one make of seroplans was used. In order to have a good sporting event various types of machines must compete At the meeting in Montreal, from the Sids inst. to July 4th, there will be two Blariot monoplanes, in addition to the fire Wright these and the biplane of J A D McGurdy There are be some other machines entered at the last the base of the machines entered at the last the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed to the second proposed t

# THE GERMAN DREADNOUGHT ANA

THE FIRST OF THE GERMAN FLEET OF DREADNOUGHTS TO BE COMPLETED

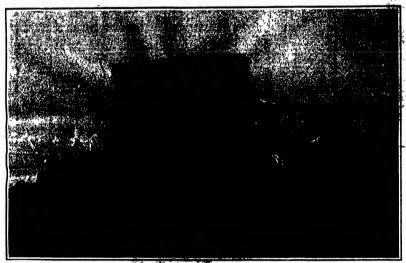

in view of the great secrety which has attended the construction of the 'Namau," the type ship of the feet of German dreadnoughts some surprise was expressed upon the first public view of the ship, that possessed, as a dreadnought, no features of rked novelty. To the people of the United States, here is something fumiliar about the arrangement of her main battery, with its armament of heavy gu carried in six turrets, one forward and one aft of the center line, and four arranged amidships quad rilaterally Their thoughts will be carried back some ritair-nilly. Their thoughts will be carried back some steenly wars to the time when the plans of our distribution with the plans of our distribution of the plans. It is not that the plans of our distribution of the plans of the plans of the plans of the plans of the plans of the plans of the plans of the plans of the plans of the plans of the plans being carried in turns forward and aft and the plans of short goas being mounted four turners two on either beam, arranged at the four crosses of the appearance. This, it will observed in practically the plan followed in the the ships of our own navy, the guns are all mounted upon the longitudinal axis of the ship, and consequently the whole power of the 18-inch bettery can be brought to hear on the broadside throughout a wide are of training.

In justification of their adoption of the quadrilaters' system of mounting, the Germans announce their con-viction that in the engagements of the future there viction that in the engagements or the future that will be more fighting in the end-on or qua tering position than the advocates of the all-centorline system of mounting believe, and they emphasize the fact tem or mounting ceneve, and tooy emphasise the lact that the "Nasaw" can not only concentrate air heavy guns in the end-on position, but that she could de-liver this heavy fire, should the exigencies of an engagement demand it, both forward and astern at the same time. Furthermore, there is a certain advantage in the fact that two gues and four to are held in reserve on the ice side and are greatly protected by the increts which are in engagement on what might be called the weather fighting side of the turret, not only would the prostable &
"New-n" be iner-said Trem \$ to 11 heavy
the end-on fire would-be strengthmed by the
of two more gum, relating it from a counse
state one of sight guns. This is the methin the new Arpustine creaters, the most
dreadmoughts now under construction, whi
asis to fire sight guns abod or sight

twaive on either broadside.

However, in estimating the merits of v sign, we must be careful to bear in misst de-sign, we must be careful to bear in misst the's of displacement, which in the "Nassan" stand very moderate Bigure of 18,500 tons; and, M member that our latest dreadnoughts have re 26,000 tons, it must surely be admitted in Cermans, in view of the limited displacement

The following dimensions, which have be through the courtesy of the German Navy Department be taken as correct. Length, 453 feet, being

Longth, 4d for, Mean, 28 for, Brand, 2015 for, Displacement, Monte, Romal continues, 19 for Space 2 Dai, Minte 1 tors not increase, 21 london, Armanogue 1 Twin 11-in.), Remail continues, 22 london 1 for the Continue of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Continues of the Cont "HAMAD" FIRST OF THE GERMAN DREADSOUGHTS.

'Nassau" Incidentally, it may be mentioned that the Japanese have adopted the same arrangement in the first dreadnoughts built for their navy

Obviously, the principal disadvantage of the system is that the ship, although she mounts tweive heavy guns, can bring only eight of them to bear upon either broadside, at least four guns being masked by the superstructure or hy the other turrets while she is fighting a broadaids engagement with the enemy In be possible for the fleet to make a complete turn of 180 degrees, and bring four hig guns, with their gun

rews entirely fresh, into the fight.

To these arguments it will, be answered that, by moving one of the four amidably turrets forward and placing it at a sufficient height to fire above "the t turret, and removing anoth aft and giving it a similar relation to the after

feet, draft, 38½ feet; displacement, 18,500 tees; normal coal supply, 840 tees. The "Nassau" is driven by triple explaces, and on her trials considerably or consider the contrast speed of 18 knots and may be set contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and the contrast and th

### An English Judicial Column of Complex Patents.

as Rugliah Justicals opinion of Compiler Petersta. The competity of prient specification phrasology, and particularly the bewlifering character of the sultime of an American patent, were recently made the subject of a decision of the House of Lords. The case, which five members of the Home were called upon to devide, was that of Linctype and Machinery Limited v. Hopkins We presume that the specification, but the condemnation of the Lords, was attained by the American specification field in England without any chauge. The following is an extract from the decision, the unanimous judgment of the five members of the House of Lords

The appelliant (i. e., the patentrees) has filed a specification which reasonbles a treatise in its length;

it contains no less than sixty olains; there is infinite ordundancy and repetition and constant reference to illustrations which are not very easy to follow. Also pather it is a document which seeds the most positive it is a document which seeds the most principals and posterating study in order than aurona, who wishes no work out problemed of injustration in this class of industry, may know where they stand and bow they may be frust round the danger of injusticals. it contains no less than sixty claims; there is infinite

remore paterns.
"The point whether this patent is good of not close in this case, but I think by in set flow, not actes publishing that those who flat and whore quantitate states explicitly that those who flat and whore quantitate cations must take the risk of having the whole thing cleared well for ampliquity. I have help consign to observe that there is a tendescy to frame qualifications.

and claims so as to pushin a streamt, and it men of bushness late saliths; one as joiness that their injury properties may be high con-they be found guilty of indipagabless. A abuse of the law and will be absorbed if

#### DEVICE FOR TESTING ELECTRIC WIRISE ----

In testing electric wiring for open circuits grounds or short circuits it is often necessary to skin the in sulation from the wires under test in a number of places so as to connect them to a magneto or other testing device. The accompanying illustration shows

TESTING MEEDLE FOR INSULATED WIRE

a device which does away with this measure for it a device which does away with his necessity for it contains a sharp needle point which can be sally pushed through the insulation until it mak s a good electrical contact with the wire within. The d vice is made out of a hard wood handle borred through aut its whole length to the diameter of Sexible lamp cerd its whose length to the diameter of flexible lamp (crid
The small send is then counterbored to a larger diam
clor and a plug is made that will drive tightly into
the counterbore. The next step is to procure a large
sized sewing needle which is driven through the plug as shown in the sketch. The eye end of the nec is soldered to a length of lamp cord which is pas

through the handle as shown. The plug is then driven into place and the testing handle is ready for use

## CLARISCOPE ATTACHMENT FOR MICHOSCOPES.

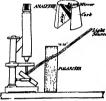

FULBRISHOPE ATTACKERS: FUR RICHMONDERS.

Illustrated herewith is a bit of apparatus by means of which polarised light may be used with any micro scope without changing the instrument itself. The polarizer consists of one down 4 x 5 inch glass negatives which have been thoroughly cleaned and dusted. and are contained in the original box, which has its top and bottom cut out, leaving just enough card around the edges to hold the plates in position

The analyzer comprises a piece of blackened cork with a wedge-shaped slot cut in one side and a bit with a wedge-shaped side (at in one side and a bit of black mirror formly pressed into position in the side at the polarising angle. This rests on the expect of the utraceops and may be turned at any angle in the horizontal plane. The black mirror is made of plate plass or cover gians, coated on the key with a mixture of impulsark and absiles varnish or. If soore convenient, impusack and give. The draw large shows the arrangement of the apparatus with the Nicola' crossed A small scale may be attached to the top of the analyzer, so that the angle through which is in turned may be noted

which it is turned may be noted.

This scheme may also be applied to a simple, or dissecting, microscope. For simplicity and cheapness, combined with a high degree of officiency, I do not

think this apparatus can be excelled to be derived from its use is infinite

## AN ELECTROPLATING OUTFIT

Those who wish to undertake the electro-deposition of measure upon a small scale whether as a business or for pleasure will find that the apparatus and uten-alls luce described will meet the ordinary require-

The photograph reproduced herewith shows the wooden depositing tank and battery of an outfit in actual use. The battery cells are hinde exactly an explained on page 445 of the Bukytiste Americay of

The depositing tank is made in the same way, with The depositing tank is made in the same way, with the exception that the joints are just together with a very thick india rubber cement of the kind used for repairing tires. The woodwork at the joints is first coated with the cement, both at the grooves and the orde, and is allowed to stand for an hour or two, when it is realted again and just together either with when it is caucie again and put together either with until driven in disgonally or with screws. The ex-cess of ribber must be wiped off. In the course of about twenty four hours the inside of the tank must be coated with a burning bot solution of paradin. Un less the paraffin is very hot, it will not penetrate the pores of the wood sufficiently to make it impervious porce of the wood sufficiently to make it impervious to any of the shemical solutions that the tank may contain. The wood used in making a depositing tank must be well seasoned. If possible use old boards one inch thick so that when planed the board is not less than seven-eighths of an inch thick, and at all times then seven-ugans of an ince, not at all times place clears across the bottom, so that it will stand clear of the floor or work bench. The rubber comment used for the joints will not be affected by any of the depositing solutions. The tank illustrated measinsect for the joints with not be affected by such the depositing solutions. The tank illustrated measures 5½ inches long, and 11 inches feep. Five such tanks as these should be made, to contain the following cold working solutions, for all or, nickel, brass copper and sinc. Gold and alkaline coppering solutions must be worked hot, as will presentiv he described

ently be described

Silver Plating - Dissolve 235 ounces silver in a glass flask by adding 3 ounces nitric acid and 1 ounce distilled water Heat the flask slightly and place it where the red nitrous fumes will pass off into a flue where the red nitrous furnes will pass off into a flue, or out of doors. When the silver has become dis-solved, add a quart of distilled water, sir the mix-ture well, thee add gradually about 5 fluid ounces pure hydrochloric acid, silrring the mixture well with a glass rod. Place the flask in a dark place while the white precipitate (chloride of silver) is settling.

Four off the clear liquid, add another quart of water; stir well, allow it to settle, decent; and wesh a third time. This will free the precipitate of impartites formed. Dissolve ½ pound equalde of potassium in & gallon of distilled water When completely dis-solved, add a small quantity at a time to the chlo-ride of silver. But the well, and continue to di-tride of silver. But the well, and continue to di-tride of silver has only just been dissolved. Allow a little time to only just been dissolved. Allow a little time to elapse between each addition. When all the chloride of allow is dissolved make up the quantity to 3% gallom with distilled water. This will be the right quantity to fill the wooden tank, with one ounce of allver to the gallon. Let this solution stand for twenty four hours, so that all dirt will settle, and then m into the tank. The solution

is now ready for use Two shorts of fine altere about 5 inches square must be used for the nancies, suspended by either copper or silver wire kooks upon the copper of copper or silver wire kooks upon the copper rod (abown in the illustration) attached to the wire from the carbon of the battery, while from the best copper rod the articles to be plated must be asspended, this rod be ing attached to the sitne of the battery. The articles a strong solution of common washing sods for trent as a trong solution of common washing sods for trent individually with a stiff stall brush dipped in punites remaining in water, and accurring them they will be solved to the silicative of German surfer, brush, or copper, after soouring and bring attached to the silicative vire, must be dipped into a solved to the silicative vire, must be dipped into a souring term. Two sheets of fine silver about 5 inches square must breas, or copper, after according and being stached to the slinging wire, must be flowed into a soliton of one onnee of nitrate of mercury in a gallon of water. This will give a chemically clean surface and cause the silver to adhere firmly when the deposit size place the silver to subsect flowers that place the silver better the place that the place the silver better to subsect flowers or forth should be subsected in the positive flowers of the soliton of the silver better to subsect flowers that the soliton of the silver better to subsect flowers that the soliton of the silver better the soliton of the silver better the soliton of the silver better the soliton of the silver better the soliton of the silver better the silver better the silver better the silver better the silver better the silver better the silver better the silver better the silver better the silver better the silver better the silver better better better the silver better 

color of Par (Paper Paris, Atticine) (Paper Paris, Atticine) (Paper Paris, Atticine) (Paper Paris, Atticine) (Paper In Maria (Paper Paris) (Paper In Maria (Paper Paris) (Paper Paris) (Paper Paper Paris) (Paper Paper Paris) (Paper Paper Paper Paris) (Paper Paper Pap of potassium in 1 quart water. Add the carbonate of opeans solution to the subhate of copper. Silv the mixture well. Add enough strong liquid ammonia to dissolve the proceiplate. Then add gradually the cyanide solution until the bits color disspears. Make up to 3 sulforas with distribled water, and after allowing the sediment to subside, pour off the clear liquid into the operating tank. Javes two anodes of frigid into the operating tank. Javes two anodes of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the control of the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clear than the clea isquid tato the depositing tank. Have two anodes six lankes square using the second anode according to the number of articles to be plated. The two battery cells above referred to will perform all the work of deposition that this article describes. The cleaning of small two retted articles should be done just as described above for silvering. When the articles are coppared they must be scratch-brushed before receiving a deposit of nicks, silver, or gold; then secured with fine pumice and water. They will then take a ne deposit of these metals.

Gold Plating—Electro-gilding in a small way is

done by making the gold solution as follows ive in 1 quart of hot distilled water 1 curies of cyanide of potassium. Take a small porous fill it about two-thirds full. Place it in the in mil it about two-thirds pull "place it in the inner ves-sal of an outment hettle, and pour in this vessel the balance of synatic solution. Pour a quart of hot water into the cuter vessel, and bring it to the hol-ing point. Take a strip of sheet copper, fix a place of separate view in the same description of separate view in the secondary of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the

gold. Remove the screen por thive saws fis ele-terate, see the emantains liquid for the spoil dispensi-ing, and the piece of sheet gold can be used lip; this anota. Any article after being will channel—sine he coated with gold in this bath, giving a very rich violent Ricks beer in the best liquid to new with a chips, brush in brightnesing the deposit previous to beside gold than for sitter. The articles after risating should be dried in hot boxwood sawdant. Since Passing—Articles can readily be coated with Ricks Passing—Articles can readily be coated with the property of the collection of the coated with the property of the collection of the coated with sites, 10° among a continue of the coated with the property of the collection of the coated with sites, 10° among a continue of the coated with sites, 10° among a continue of the coated with sites, 10° among a continue of the coated with sites, 10° among a coated with the coated with sites, 10° among a continue of the coated with sites, 10° among a continue of possessing and coated with the coated as sirry of sheet cop-per the width of the porcus pot in each, and connect the copper with the battery as for gold, using two large clean rine plates in the ammonia grantes col-rent on until about 5 connect of the have been tiscolved. Remove the porcus cells and throw the contepts away.

COMPLETE OUTFIT FOR ELECTROPLATING.

Add 5 ounces carbonate of potash, silr until dissolved, et the liquid stand until the dirty matter has subsidied, at the liquid stand until the dirty matter has subsidied, and these sjohn gift the dear liquid, which is should be related to the standard of the standard the subsidied by this solution. The articles should be related to the standard to the subsidied by this solution. The articles should be related to the subsidied by this solution. The articles should be related to the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by the subsidied by ate of potash, stir until dis

I quart water, 5 ounces sulphate of sine dissolved in \$\frac{1}{2}\$ gallon hot water Let all the solutions be cold be-fore mixing. Add to the acetate of copper solution \$\frac{1}{2}\$ bint strong water ammonia, 0.880 Just before final mixing, stir this well and add to it the sine solufinal mixing, stir this well and add to it the sine soits ton, together with another y just strong ammonia. Stir this mixture well, then add the potash solution. Stir this mixture well, then add the potash solution and jastry the cynnide solution. Allow this to stand size making the quantity up to four gailons. At the add of about 15 hours poor the clear liquid into the depositing tank, for use. Clean the articles as for eliver pinting, use the battery coupled in multiple, and a large brass anods, arranged so as to regulate and a large brass anods, arranged so as to regulate the quantity of surfaces the liquid. The exact color the quantity of surface in the liquid. The exact color can be obtained by relating and lowering the amode. After a quarter of an hour the articles must be removed, rissed, seretal-bruthed, and returned to the bath for the final deposite. In every eigh in the edge-to-depositing of mustals, suppositely in this gold and breaming, the solor onto the variest by moving the article to and fro in the solvedon during deposition. Silver is also affected by this messan, this deposit boths, we have a supposed on the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the contro

MANGAGESE STREE HATES

(Concluded from page 518)
rails used by the Boston Elevated rand usou by the Boston Elevated upon the curren were formed by casting. This is, of course, an expensive process in fact, this corporation rati costs about \$5 per foot for the rails. The ordi nary rail costs only about 38 cents per foot, or only 1/3 as much. But even then it is remarded as a good investment, because of the very long life. In the an tunin of 1908 the company had in service tunin of 1808 the company had in service 475 feet of this rail in addition to three crossing frogs and a number of ordinary frogs. Its experience is certainly worthy of attention However, if manganese steel can be rolled to advantage, we may steel can be rolled to advantage, we may seel see a still better material at a lower figure. In fact, such ralls have been rolled to sell for about \$200 per tou, or about \$2.50 per foot (about 85 pound see set) 144 (ton).

directly over the tri behind so that the atch him Shortly the train and, before alignment two large circles above the field his destination

nis destination.

The greater part of the trip Hamilton flew at a comparatively slight elevation—about 200 feet. Even in passing over the city of Treuton he rose to only double this height, as he preferred to take the chance of his motor stopping and of his being obliged to descend rather than to cut down his average speed by rising

to a great elevation

The various cities and towns along
the route were passed upon schedule

After reaching the field at North Phila delphia and circling about a couple of times Hamilton alighted gracefully at 9 26 A. M., Just 1 hour and 50 minutes from the time he started if a deduction is made for the circling about at the start of fine and finish, the actual time of the slight was about 1 hour and 46 minutes. The article circlings in 44 mins from Government of the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the circling and the 9 26 A M. just 1 bour and 50 minutes

may semogramen. Light being greated by Governe, and delivering to him the me shown in one of our illusir mitton refilled his fuel and oil nearyen on minutes in starting, and de-apite the fact that the train was driven at the fastest possible speed-80 miles an hour or more—its occupants did not eatch sight of Hamilton until 33 minutes each sight of Hamilton until 32 minutes after they started, while it was about 10 minutes later before they finally over-hauled blm, 2 miles beyond Princeton Junction and 39 miles from the start. Thirty-seren miles had been covered by the special in 34 minutes, including a stop of 2 minutes at Bristol caused by an express trails being in the way. The an express train being in the way. The train and servoplase traveled abresst of each other for a white, and finally Han-tillon dropped slightly behind. He had-covered the first 38 miles of this return formay at the rate of 113 miles as hour, thus making the fastest cross-country light yet accomplated at the small vil-lage of Phinasbore, 41 miles from North Mildelphia, Hamilton again few overraissospais, limition again new over the tracks a thousand feet or more back of the train. The heavy clouds of smooths from the locomotive caused him to seek a higher elevation, and he rose to a height of about 500 feet. Soon after crossing the Raritan River the occupants crossing the Haritan Edwer the occupants of the train were surprised to see Ham itton turn off to the right and pass out of view. It seems he mistook the river for the Kill von Kull, and started, of of view It seems he mistock the river for the Kill von Kuil, and started, of course, toward what he unpposed to be downwards intend. The engine had been missing five on several cylinders, and it is a missing five on several cylinders, and it is a missing five on several cylinders, and it is a missing five on several cylinders, and the decided to alistic, but was quite distingted to find himself in a marsh, from which the meahine was dragard out with no little difficulty. In attempting to several control of the course, in color location beach as proposition of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color of the color o the city the engine again started ing and running on but six cylin Fortunately, however, his height was saint on that he summered in Fortunately, however, his height was nut-ficient, so that he just aucosedd in mak-ing Governor's Island during the course of his iong descent. The 19% miles air-line distance from South Amboy to the Island was covered in about 28 min-utes, and he finally slighted in front of the about 45 Mp. Mr.

the shed at 6 40 P. M.
In addition to this being probably the
fastest cross-country flight ever executed,
Hamilton's performance was a spectacu
lar one, since the flight was made over
water, cities, and open country. When
news was received at New Tork that be
had started on the aviews pin; flowered. water, cities, news was received at New Yors, had started on the return trip, thousan of neople gathered at the Battery, expe of people gathered at the Battery, in the sea him arrive at Govern and at about 1 15 P M. When came that he had been forged to the growd was greatly disapp Netwitheicas, there was a large aliabted b

the inschine, and the aviator of the coinion that some miss expression this opinion that some miss-platon rings in one ge type of the indexe allowed oil to escape by the ion and foul the spark plugs. There is interruption in the sparking cur-t supplied by the high-tension Booch mote. At any rate, Hamilton's flights was the nonstitute of magnete. At any rate, Hamilton's nignts showed the possibility of carrying mail and important dispatches, and it is intor-esting to note that Representative Shop-herd of Texas has introduced a bill into Congress calling for the investigation of at Office Department into the sere plane for the purpose of carrying mail
Also a few days after Hamilton's
flight, the French war authorities com manded M Biériot to carry a message from the camp of Chaions to Paris, which he did promptly in his monoplane with out any mishap During the present week Hamilton is to experiment for the government at Nashville, Tenn upon the dropping of explosi es from his machine There arner townia will be carried on dur ing the maneuvers

The flights of Custles and Hamilton have spurred many budding aviator attempt in the near future some of the cross country flights for prizes, and new prizes are being offered almost daily for We wish to remind such svi ators that they stand a chause of ning the Scientiste Augustan Trouby If they send in their cutty to us or to the Aero Club of America twenty four bours in advance. The aviator making the est cross-country fight this year will win the trophy for 1910

S) WALTER ( COLD

There are three qualities of emery used in this country-Naxos or Greek, Turk ish, and American

The Naxos brand is imported from th island of Naxos (Greeian Archipelage) Greecs, the mines being controlled by the Greeian government Naxos smery con tains a large percentage of alumina (about 65 per cent) This emery has a (about 65 per cont) This emery has a most excellent fracture, the grains beins, very hard and very pharp, and therefore specially adopted for use in gridding wheels. These characteristics prevent its use, to any solute, for polishing pur-poses, as it rather 'breaks down' nor granulates under pressure of the work, as do the other quantities (Tertals and Americas). An ideal enery for plaths ing must present new cutting points con stantly The Naxos grains are so hard and sharp that it does not properly gran ulate, therefore it is not a desirable pol-ishing medium, except for certain special classes of work. Naxos emery, owing to

tis large percentage of alumina, follows corundum in the scale of hardness Good Turkish smerry contains any where from 10 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per cent to 15 per

activet emery produced, yet is succe fully and largely used for certain class of "soft work."

Most of the Naxos and Turkish emery brought to this country comes in pieces ranging from the size of a marble up to \$5 or 20 pounds in weight. Formerly it was brought over as ballast in ships, but ft became such an important comm mercially, that during the last quar commercially, that during the last quar-illy contray; the speen transported across the water as regular cargo. Turkish qu-cer is brought to the asports of Asia Makor in the same primitive fashoot which has exhibed for many years—on May have defaught. These are an up-to-lishs mining meshods. The one is taken

338 Pages. 314 Illustrations. Price \$2.00 postpaid The object of these books is to instruct boys how to build various devices and apparatus, perticularly for outdoor use. The constructions are fully within the scope of the average boy and the instructions are interwoven in a story which makes the books interesting as well as instructive.

MUNN & CO., Inc., Publishers, 361 Broadway, New York

from the surface only, and no attempt is mads to follow the emery "leads" when they dip below the surface. Thus their casy and below the surface. Thus their mining methods are thoroughly charac-teriatic of the inhabitants of the entire Turkish empire—crude and antiquated Emery imported from Asia Miner is branded according to the seaport from which it is shipped, the scaports being Smyrna, Kulluk and Syra, the raitway points are Knyujack, Alden, and Azizick The different brands of course vary ac carding to the parity of the emery—the larges the amount of oxide of alumina, the letter the quality

The American emery is mined near Peckskill, New York State. Some very excellent ore has been taken out at that place but the bulk of the emery is high onace but the blink of the omery is high in oxide of tron and therefore soft There is also a smoot deposit in the Star-of kansas, but the deposit is insignifi-cant and the quality of the emery of an inferior character

The following are the physical proper ties of emery. Color black or blue black, specific gravity, 9 1050 ounce. It is thus placed in scale of hardmas. Pure Naxos

special gravity, p. 1656 outer. It is thus priced in solic of fordiness. Pure Naxos St., pure Turkish St., pure American St., title diamond tring No. 10). In its manufacture the emery pusses. through good chilled tolls and croshed. It then purses over screens toade from holiting cloth and from the secons to is parked directly into full keen holding Lathe Book pounds and quarter logs of about 75 Tennick, the number of the energy tennick, the number of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energy tennick of the energ the second mine are the fine grain the last four are "flours" in addit the last four are "flours" in addition to these there are still fluor flours. These are especially fluo and used principally

In optical work About 50 per cent of all emery is washed with water and then 'blown' with a blower to remove the micaccou-assistates and other foreign matter. Em ery so treated of course costs more to produce, but this treatment results in a nure article—one whi 78 will cut more keenly and be more durable than

Viich improvement has taken place in the manufacture of emery in years, the principal innovation being the 'toucentrating' anchine through the use of a bich the curry is 'mulicd' This process also removes the micaceous assoclates and relicus the emery of low

The consumption of emery in this country for both grinding wheels and pollabing purposes, in 1909 was about 9000 short tons or 18003,000 pounds

Emry is a commodity in the man facturing world which is absolutely in dispensable and the use of it is con disjonators and the base of it is con-stantly increasing. There is no material for polishing purposes which could be successfully substituted for the reason that it is peculiarly fitted for this work. For polishing purposes corunding is too bard, on the other hand garnet, quarts, and flint are entirely unfitted—they lack that objected property of toughness which is possessed to a marked degree by

It is stated in the Electrical World that It is stated in the stocking that 5 900,000 horse power actually represented by the Ningara Falls, only about 55 per cent, or about 270 900 horse power, has been thus far utilized Of this, 126 has been thus far utilised to this, 129
600 horse-power is employed in electrochemical provesses 56,000 horse-power
for railway service 36 400 horse-power
for lighting, and 45,500 horse-power for
various industrial services Nearly 125,
600 horse-power is transmitted to points more than ten miles from the falls. Cf this amount 12,300 horse-power is trans mitted over a distance of more than 100 miles, while 33,500 horse power is trans mitted between 75 and 100 miles
